ABSTRACT

This disclosure relates to video coding and more particularly
to techniques for signaling picture timing and decoding unit
information for coded video. According to an aspect of an
invention, a flag syntax element, specifying whether decod-
ing unit level decoded picture buffer output delay parameters
are present in a picture timing message, in a buffering period
message is parsed and a first syntax element, used to
compute a decoded picture buffer output time, in the picture
timing message is parsed, in a case that a value of the flag
syntax element is equal to one.

SYSTEMS AND METHODS FOR SIGNALING PICTURE TIMING AND DECODING UNIT INFORMATION IN VIDEO CODING

TECHNICAL FIELD

[0001] This disclosure relates to video coding and more particularly to techniques for signaling picture timing and decoding unit information for coded video.

BACKGROUND ART

[0002] Digital video capabilities can be incorporated into a wide range of devices, including digital televisions, laptop or desktop computers, tablet computers, digital recording devices, digital media players, video gaming devices, cellular telephones, including so-called smartphones, medical imaging devices, and the like. Digital video may be coded according to a video coding standard. Video coding standards define the format of a compliant bitstream encapsulating coded video data. A compliant bitstream is a data structure that may be received and decoded by a video decoding device to generate reconstructed video data. Video coding standards may incorporate video compression techniques. Examples of video coding standards include ISO/IEC MPEG-4 Visual and ITU-T H.264 (also known as ISO/IEC MPEG-4 AVC) and High-Efficiency Video Coding (HEVC). HEVC is described in High Efficiency Video Coding (HEVC), Rec. ITU-T H.265, December 2016, which is incorporated by reference, and referred to herein as ITU-T H.265. Extensions and improvements for ITU-T H.265 are currently being considered for the development of next generation video coding standards. For example, the ITU-T Video Coding Experts Group (VCEG) and ISO/IEC (Moving Picture Experts Group (MPEG) (collectively referred to as the Joint Video Exploration Team (JVET)) are working to standardized video coding technology with a compression capability that significantly exceeds that of the current HEVC standard. The Joint Exploration Model 7 (JEM 7), Algorithm Description of Joint Exploration Test Model 7 (JEM 7), ISO/IEC JTC1/SC29/WG11 Document: JVET-G1001, July 2017, Torino, IT, which is incorporated by reference herein, describes the coding features that were under coordinated test model study by the JVET as potentially enhancing video coding technology beyond the capabilities of ITU-T H.265. It should be noted that the coding features of JEM 7 are implemented in JEM reference software. As used herein, the term JEM may collectively refer to algorithms included in JEM 7 and implementations of JEM reference software. Further, in response to a “Joint Call for Proposals on Video Compression with Capabilities beyond HEVC,” jointly issued by VCEG and MPEG, multiple descriptions of video coding tools were proposed by various groups at the 10th Meeting of ISO/IEC JTC1/SC29/WG11 16-20 Apr. 2018, San Diego, CA. From the multiple descriptions of video coding tools, a resulting initial draft text of a video coding specification is described in “Versatile Video Coding (Draft 1),” 10th Meeting of ISO/IEC JTC1/SC29/WG11 16-20 Apr. 2018, San Diego, CA, document JVET-J1001-v2, which is incorporated by reference herein, and referred to as JVET-J1001. The current development of a next generation video coding standard by the VCEG and MPEG is referred to as the Versatile Video Coding (VVC) project. “Versatile Video Coding (Draft 7),” 16th Meeting of ISO/IEC JTC1/SC29/WG11 1-11 Oct. 2019, Geneva, CH,

document JVET-P2001-vE, which is incorporated by reference herein, and referred to as JVET-P2001, represents the current iteration of the draft text of a video coding specification corresponding to the VVC project.

[0003] Video compression techniques enable data requirements for storing and transmitting video data to be reduced. Video compression techniques may reduce data requirements by exploiting the inherent redundancies in a video sequence. Video compression techniques may sub-divide a video sequence into successively smaller portions (i.e., groups of pictures within a video sequence, a picture within a group of pictures, regions within a picture, sub-regions within regions, etc.). Intra prediction coding techniques (e.g., spatial prediction techniques within a picture) and inter prediction techniques (i.e., inter-picture techniques (temporal)) may be used to generate difference values between a unit of video data to be coded and a reference unit of video data. The difference values may be referred to as residual data. Residual data may be coded as quantized transform coefficients. Syntax elements may relate residual data and a reference coding unit (e.g., intra-prediction mode indices, and motion information). Residual data and syntax elements may be entropy coded. Entropy encoded residual data and syntax elements may be included in data structures forming a compliant bitstream.

SUMMARY OF INVENTION

[0004] In one example, a method of receiving a picture timing message, the method comprising: receiving a buffering period message; parsing a flag syntax element, specifying whether decoding unit level decoded picture buffer output delay parameters are present in the picture timing message, in the buffering period message; receiving the picture timing message; and parsing a first syntax element, used to compute a decoded picture buffer output time, in the picture timing message, in a case that a value of the flag syntax element is equal to one.

[0005] In one example, a device of receiving a picture timing message, the device comprising: a processor, and a memory associated with the processor; wherein the processor is configured to perform the following steps: receiving a buffering period message; parsing a flag syntax element, specifying whether decoding unit level decoded picture buffer output delay parameters are present in the picture timing message, in the buffering period message; receiving the picture timing message; and parsing a first syntax element, used to compute a decoded picture buffer output time, in the picture timing message, in a case that a value of the flag syntax element is equal to one.

[0006] In one example, a method of signaling a picture timing message, the method comprising: signaling a buffering period message including a flag syntax element specifying whether decoding unit level decoded picture buffer output delay parameters are present in the picture timing message; and signaling the picture timing message including a first syntax element used to compute a decoded picture buffer output time, in a case that a value of the flag syntax element is equal to one.

[0007] In one example, a device of signaling a picture timing message, the device comprising: a processor, and a memory associated with the processor; wherein the processor is configured to perform the following steps: signaling a buffering period message including a flag syntax element specifying whether decoding unit level decoded picture

buffer output delay parameters are present in the picture timing message; and signaling the picture timing message including a first syntax element used to compute a decoded picture buffer output time, in a case that a value of the flag syntax element is equal to one.

BRIEF DESCRIPTION OF DRAWINGS

[0008] FIG. 1 is a block diagram illustrating an example of a system that may be configured to encode and decode video data according to one or more techniques of this disclosure.

[0009] FIG. 2 is a conceptual diagram illustrating coded video data and corresponding data structures according to one or more techniques of this disclosure.

[0010] FIG. 3 is a conceptual diagram illustrating a data structure encapsulating coded video data and corresponding metadata according to one or more techniques of this disclosure.

[0011] FIG. 4 is a conceptual drawing illustrating an example of components that may be included in an implementation of a system that may be configured to encode and decode video data according to one or more techniques of this disclosure.

[0012] FIG. 5 is a block diagram illustrating an example of a video encoder that may be configured to encode video data according to one or more techniques of this disclosure.

[0013] FIG. 6 is a block diagram illustrating an example of a video decoder that may be configured to decode video data according to one or more techniques of this disclosure.

DESCRIPTION OF EMBODIMENTS

[0014] In general, this disclosure describes various techniques for coding video data. In particular, this disclosure describes techniques for signaling picture timing and decoding unit (DU) information for coded video data. It should be noted that although techniques of this disclosure are described with respect to ITU-T H.264, ITU-T H.265, JEM, and JVET-P2001, the techniques of this disclosure are generally applicable to video coding. For example, the coding techniques described herein may be incorporated into video coding systems, (including video coding systems based on future video coding standards) including video block structures, intra prediction techniques, inter prediction techniques, transform techniques, filtering techniques, and/or entropy coding techniques other than those included in ITU-T H.265, JEM, and JVET-P2001. Thus, reference to ITU-T H.264, ITU-T H.265, JEM, and/or JVET-P2001 is for descriptive purposes and should not be construed to limit the scope of the techniques described herein. Further, it should be noted that incorporation by reference of documents herein is for descriptive purposes and should not be construed to limit or create ambiguity with respect to terms used herein. For example, in the case where an incorporated reference provides a different definition of a term than another incorporated reference and/or as the term is used herein, the term should be interpreted in a manner that broadly includes each respective definition and/or in a manner that includes each of the particular definitions in the alternative.

[0015] In one example, a method of signaling decoding unit parameters for video data, the method comprises signaling a syntax element indicating whether decoding unit parameters are included in a picture timing message and

conditionally signaling decoding unit parameters in a picture timing message based on the value of the syntax element.

[0016] In one example, a device comprises one or more processors configured to signal a syntax element indicating whether decoding unit parameters are included in a picture timing message and conditionally signal decoding unit parameters in a picture timing message based on the value of the syntax element.

[0017] In one example, a non-transitory computer-readable storage medium comprises instructions stored thereon that, when executed, cause one or more processors of a device to signal a syntax element indicating whether decoding unit parameters are included in a picture timing message and conditionally signal decoding unit parameters in a picture timing message based on the value of the syntax element.

[0018] In one example, an apparatus comprises means for signaling a syntax element indicating whether decoding unit parameters are included in a picture timing message and means for conditionally signaling decoding unit parameters in a picture timing message based on the value of the syntax element.

[0019] In one example, a method of decoding video data comprises parsing a syntax element indicating whether decoding unit parameters are included in a picture timing message and conditionally parsing decoding unit parameters in a picture timing message based on the value of the syntax element.

[0020] In one example, a device comprises one or more processors configured to parse syntax element indicating whether decoding unit parameters are included in a picture timing message and conditionally parse decoding unit parameters in a picture timing message based on the value of the syntax element.

[0021] In one example, a non-transitory computer-readable storage medium comprises instructions stored thereon that, when executed, cause one or more processors of a device to parse syntax element indicating whether decoding unit parameters are included in a picture timing message and conditionally parse decoding unit parameters in a picture timing message based on the value of the syntax element.

[0022] In one example, an apparatus comprises means for parsing a syntax element indicating whether decoding unit parameters are included in a picture timing message and means for conditionally parsing decoding unit parameters in a picture timing message based on the value of the syntax element.

[0023] The details of one or more examples are set forth in the accompanying drawings and the description below. Other features, objects, and advantages will be apparent from the description and drawings, and from the claims.

[0024] Video content includes video sequences comprised of a series of frames (or pictures). A series of frames may also be referred to as a group of pictures (GOP). Each video frame or picture may be divided into one or more regions. Regions may be defined according to a base unit (e.g., a video block) and sets of rules defining a region. For example, a rule defining a region may be that a region must be an integer number of video blocks arranged in a rectangle. Further, video blocks in a region may be ordered according to a scan pattern (e.g., a raster scan). As used herein, the term video block may generally refer to an area of a picture or may more specifically refer to the largest array of sample values that may be predictively coded, sub-

divisions thereof, and/or corresponding structures. Further, the term current video block may refer to an area of a picture being encoded or decoded. A video block may be defined as an array of sample values. It should be noted that in some cases pixel values may be described as including sample values for respective components of video data, which may also be referred to as color components, (e.g., luma (Y) and chroma (Cb and Cr) components or red, green, and blue components). It should be noted that in some cases, the terms pixel value and sample value are used interchangeably. Further, in some cases, a pixel or sample may be referred to as a pel. A video sampling format, which may also be referred to as a chroma format, may define the number of chroma samples included in a video block with respect to the number of luma samples included in a video block. For example, for the 4:2:0 sampling format, the sampling rate for the luma component is twice that of the chroma components for both the horizontal and vertical directions.

[0025] A video encoder may perform predictive encoding on video blocks and sub-divisions thereof. Video blocks and sub-divisions thereof may be referred to as nodes. ITU-T H.264 specifies a macroblock including 16×16 luma samples. That is, in ITU-T H.264, a picture is segmented into macroblocks. ITU-T H.265 specifies an analogous Coding Tree Unit (CTU) structure (which may be referred to as a largest coding unit (LCU)). In ITU-T H.265, pictures are segmented into CTUs. In ITU-T H.265, for a picture, a CTU size may be set as including 16×16, 32×32, or 64×64 luma samples. In ITU-T H.265, a CTU is composed of respective Coding Tree Blocks (CTB) for each component of video data (e.g., luma (Y) and chroma (Cb and Cr). It should be noted that video having one luma component and the two corresponding chroma components may be described as having two channels, i.e., a luma channel and a chroma channel. Further, in ITU-T H.265, a CTU may be partitioned according to a quadtree (QT) partitioning structure, which results in the CTBs of the CTU being partitioned into Coding Blocks (CB). That is, in ITU-T H.265, a CTU may be partitioned into quadtree leaf nodes. According to ITU-T H.265, one luma CB together with two corresponding chroma CBs and associated syntax elements are referred to as a coding unit (CU). In ITU-T H.265, a minimum allowed size of a CB may be signaled. In ITU-T H.265, the smallest minimum allowed size of a luma CB is 8×8 luma samples. In ITU-T H.265, the decision to code a picture area using intra prediction or inter prediction is made at the CU level.

[0026] In ITU-T H.265, a CU is associated with a prediction unit structure having its root at the CU. In ITU-T H.265, prediction unit structures allow luma and chroma CBs to be split for purposes of generating corresponding reference samples. That is, in ITU-T H.265, luma and chroma CBs may be split into respective luma and chroma prediction blocks (PBs), where a PB includes a block of sample values for which the same prediction is applied. In ITU-T H.265, a CB may be partitioned into 1, 2, or 4 PBs. ITU-T H.265 supports PB sizes from 64×64 samples down to 4×4 samples. In ITU-T H.265, square PBs are supported for intra prediction, where a CB may form the PB or the CB may be split into four square PBs. In ITU-T H.265, in addition to the square PBs, rectangular PBs are supported for inter prediction, where a CB may be halved vertically or horizontally to form PBs. Further, it should be noted that in ITU-T H.265, for inter prediction, four asymmetric PB partitions are

supported, where the CB is partitioned into two PBs at one quarter of the height (at the top or the bottom) or width (at the left or the right) of the CB. Intra prediction data (e.g., intra prediction mode syntax elements) or inter prediction data (e.g., motion data syntax elements) corresponding to a PB is used to produce reference and/or predicted sample values for the PB.

[0027] JEM specifies a CTU having a maximum size of 256×256 luma samples. JEM specifies a quadtree plus binary tree (QTBT) block structure. In JEM, the QTBT structure enables quadtree leaf nodes to be further partitioned by a binary tree (BT) structure. That is, in JEM, the binary tree structure enables quadtree leaf nodes to be recursively divided vertically or horizontally. In JVET-P2001, CTUs are partitioned according a quadtree plus multi-type tree (QMTT or QT+MTT) structure. The QMTT in JVET-P2001 is similar to the QTBT in JEM. However, in JVET-P2001, in addition to indicating binary splits, the multi-type tree may indicate so-called ternary (or triple tree (TT)) splits. A ternary split divides a block vertically or horizontally into three blocks. In the case of a vertical TT split, a block is divided at one quarter of its width from the left edge and at one quarter its width from the right edge and in the case of a horizontal TT split a block is at one quarter of its height from the top edge and at one quarter of its height from the bottom edge.

[0028] As described above, each video frame or picture may be divided into one or more regions. For example, according to ITU-T H.265, each video frame or picture may be partitioned to include one or more slices and further partitioned to include one or more tiles, where each slice includes a sequence of CTUs (e.g., in raster scan order) and where a tile is a sequence of CTUs corresponding to a rectangular area of a picture. It should be noted that a slice, in ITU-T H.265, is a sequence of one or more slice segments starting with an independent slice segment and containing all subsequent dependent slice segments (if any) that precede the next independent slice segment (if any). A slice segment, like a slice, is a sequence of CTUs. Thus, in some cases, the terms slice and slice segment may be used interchangeably to indicate a sequence of CTUs arranged in a raster scan order. Further, it should be noted that in ITU-T H.265, a tile may consist of CTUs contained in more than one slice and a slice may consist of CTUs contained in more than one tile. However, ITU-T H.265 provides that one or both of the following conditions shall be fulfilled: (1) All CTUs in a slice belong to the same tile; and (2) All CTUs in a tile belong to the same slice.

[0029] With respect to JVET-P2001, slices are required to consist of an integer number of complete tiles or an integer number of consecutive complete CTU rows within a tile, instead of only being required to consist of an integer number of CTUs. It should be noted that in JVET-P2001, the slice design does not include slice segments (i.e., no independent/dependent slice segments). Thus, in JVET-P2001, a picture may include a single tile, where the single tile is contained within a single slice or a picture may include multiple tiles where the multiple tiles (or CTU rows thereof) may be contained within one or more slices. In JVET-P2001, the partitioning of a picture into tiles is specified by specifying respective heights for tile rows and respective widths for tile columns. Thus, in JVET-P2001 a tile is a rectangular region of CTUs within a particular tile row and a particular tile column position. Further, it should be noted that JVET-

P2001 provides where a picture may be partitioned into subpictures, where a subpicture is a rectangular region of a CTUs within a picture. The top-left CTU of a subpicture may be located at any CTU position within a picture with subpictures being constrained to include one or more slices. Thus, unlike a tile, a subpicture is not necessarily limited to a particular row and column position. It should be noted that subpictures may be useful for encapsulating regions of interest within a picture and a sub-bitstream extraction process may be used to only decode and display a particular region of interest. That is, as described in further detail below, a bitstream of coded video data includes a sequence of network abstraction layer (NAL) units, where a NAL unit encapsulates coded video data, (i.e., video data corresponding to a slice of picture) or a NAL unit encapsulates metadata used for decoding video data (e.g., a parameter set) and a sub-bitstream extraction process forms a new bitstream by removing one or more NAL units from a bitstream.

[0030] FIG. 2 is a conceptual diagram illustrating an example of a picture within a group of pictures partitioned according to tiles, slices, and subpictures. It should be noted that the techniques described herein may be applicable to tiles, slices, subpictures, sub-divisions thereof and/or equivalent structures thereto. That is, the techniques described herein may be generally applicable regardless of how a picture is partitioned into regions. For example, in some cases, the techniques described herein may be applicable in cases where a tile may be partitioned into so-called bricks, where a brick is a rectangular region of CTU rows within a particular tile. Further, for example, in some cases, the techniques described herein may be applicable in cases where one or more tiles may be included in so-called tile groups, where a tile group includes an integer number of adjacent tiles. In the example illustrated in FIG. 2, Pic₃ is illustrated as including 16 tiles (i.e., Tile₀ to Tile₁₅) and three slices (i.e., Slice₀ to Slice₂). In the example illustrated in FIG. 2, Slice₀ includes four tiles (i.e., Tile₀ to Tile₃), Slice₁ includes eight tiles (i.e., Tile₄ to Tile₁₁), and Slice₂ includes four tiles (i.e., Tile₁₂ to Tile₁₅). Further, as illustrated in the example of FIG. 2, Pic₃ is illustrated as including two subpictures (i.e., Subpicture₀ and Subpicture₁), where Subpicture₀ includes Slice₀ and Slice₁ and where Subpicture₁ includes Slice₂. As described above, subpictures may be useful for encapsulating regions of interest within a picture and a sub-bitstream extraction process may be used in order to selectively decode (and display) a region interest. For example, referring to FIG. 2, Subpicture₀ may correspond to an action portion of a sporting event presentation (e.g., a view of the field) and Subpicture₁ may correspond to a scrolling banner displayed during the sporting event presentation. By using organizing a picture into subpictures in this manner, a viewer may be able to disable the display of the scrolling banner. That is, through a sub-bitstream extraction process Slice₂ NAL unit may be removed from a bitstream (and thus not decoded and/or displayed) and Slice₀ NAL unit and Slice₁ NAL unit may be decoded and displayed. The encapsulation of slices of a picture into respective NAL unit data structures and sub-bitstream extraction are described in further detail below.

[0031] For intra prediction coding, an intra prediction mode may specify the location of reference samples within a picture. In ITU-T H.265, defined possible intra prediction modes include a planar (i.e., surface fitting) prediction mode, a DC (i.e., flat overall averaging) prediction mode,

and 33 angular prediction modes (predMode: 2-34). In JEM, defined possible intra-prediction modes include a planar prediction mode, a DC prediction mode, and 65 angular prediction modes. It should be noted that planar and DC prediction modes may be referred to as non-directional prediction modes and that angular prediction modes may be referred to as directional prediction modes. It should be noted that the techniques described herein may be generally applicable regardless of the number of defined possible prediction modes.

[0032] For inter prediction coding, a reference picture is determined and a motion vector (MV) identifies samples in the reference picture that are used to generate a prediction for a current video block. For example, a current video block may be predicted using reference sample values located in one or more previously coded picture (s) and a motion vector is used to indicate the location of the reference block relative to the current video block. A motion vector may describe, for example, a horizontal displacement component of the motion vector (i.e., MV_x), a vertical displacement component of the motion vector (i.e., MV_y), and a resolution for the motion vector (e.g., one-quarter pixel precision, one-half pixel precision, one-pixel precision, two-pixel precision, four-pixel precision). Previously decoded pictures, which may include pictures output before or after a current picture, may be organized into one or more to reference pictures lists and identified using a reference picture index value. Further, in inter prediction coding, uni-prediction refers to generating a prediction using sample values from a single reference picture and bi-prediction refers to generating a prediction using respective sample values from two reference pictures. That is, in uni-prediction, a single reference picture and corresponding motion vector are used to generate a prediction for a current video block and in bi-prediction, a first reference picture and corresponding first motion vector and a second reference picture and corresponding second motion vector are used to generate a prediction for a current video block. In bi-prediction, respective sample values are combined (e.g., added, rounded, and clipped, or averaged according to weights) to generate a prediction. Pictures and regions thereof may be classified based on which types of prediction modes may be utilized for encoding video blocks thereof. That is, for regions having a B type (e.g., a B slice), bi-prediction, uni-prediction, and intra prediction modes may be utilized, for regions having a P type (e.g., a P slice), uni-prediction, and intra prediction modes may be utilized, and for regions having an I type (e.g., an I slice), only intra prediction modes may be utilized. As described above, reference pictures are identified through reference indices. For example, for a P slice, there may be a single reference picture list, RefPicList0 and for a B slice, there may be a second independent reference picture list, RefPicList1, in addition to RefPicList0. It should be noted that for uni-prediction in a B slice, one of RefPicList0 or RefPicList1 may be used to generate a prediction. Further, it should be noted that during the decoding process, at the onset of decoding a picture, reference picture list(s) are generated from previously decoded pictures stored in a decoded picture buffer (DPB).

[0033] Further, a coding standard may support various modes of motion vector prediction. Motion vector prediction enables the value of a motion vector for a current video block to be derived based on another motion vector. For example, a set of candidate blocks having associated motion

information may be derived from spatial neighboring blocks and temporal neighboring blocks to the current video block. Further, generated (or default) motion information may be used for motion vector prediction. Examples of motion vector prediction include advanced motion vector prediction (AMVP), temporal motion vector prediction (TMVP), so-called “merge” mode, and “skip” and “direct” motion inference. Further, other examples of motion vector prediction include advanced temporal motion vector prediction (ATMVP) and Spatial-temporal motion vector prediction (STMVP). For motion vector prediction, both a video encoder and video decoder perform the same process to derive a set of candidates. Thus, for a current video block, the same set of candidates is generated during encoding and decoding.

[0034] As described above, for inter prediction coding, reference samples in a previously coded picture are used for coding video blocks in a current picture. Previously coded pictures which are available for use as reference when coding a current picture are referred to as reference pictures. It should be noted that the decoding order does not necessarily correspond with the picture output order, i.e., the temporal order of pictures in a video sequence. In ITU-T H.265, when a picture is decoded it is stored to a decoded picture buffer (DPB) (which may be referred to as frame buffer, a reference buffer, a reference picture buffer, or the like). In ITU-T H.265, pictures stored to the DPB are removed from the DPB when they have been output and are no longer needed for coding subsequent pictures. In ITU-T H.265, a determination of whether pictures should be removed from the DPB is invoked once per picture, after decoding a slice header, i.e., at the onset of decoding a picture. For example, referring to FIG. 2, Pic_2 is illustrated as referencing Pic_1 . Similarly, Pic_3 is illustrated as referencing Pic_0 . With respect to FIG. 2, assuming the picture number corresponds to the decoding order, the DPB would be populated as follows: after decoding Pic_0 , the DPB would include $\{Pic_0\}$; at the onset of decoding Pic_1 , the DPB would include $\{Pic_0\}$; after decoding Pic_1 , the DPB would include $\{Pic_0, Pic_1\}$; at the onset of decoding Pic_2 , the DPB would include $\{Pic_0, Pic_1\}$. Pic_2 would then be decoded with reference to Pic_1 and after decoding Pic_2 , the DPB would include $\{Pic_0, Pic_1, Pic_2\}$. At the onset of decoding Pic_3 , pictures Pic_0 and Pic_1 would be marked for removal from the DPB, as they are not needed for decoding Pic_3 (or any subsequent pictures, not shown) and assuming Pic_1 and Pic_2 have been output, the DPB would be updated to include $\{Pic_0\}$. Pic_3 would then be decoded by referencing Pic_0 . The process of marking pictures for removal from a DPB may be referred to as reference picture set (RPS) management.

[0035] As described above, intra prediction data or inter prediction data is used to produce reference sample values for a block of sample values. The difference between sample values included in a current PB, or another type of picture area structure, and associated reference samples (e.g., those generated using a prediction) may be referred to as residual data. Residual data may include respective arrays of difference values corresponding to each component of video data. Residual data may be in the pixel domain. A transform, such as, a discrete cosine transform (DCT), a discrete sine transform (DST), an integer transform, a wavelet transform, or a conceptually similar transform, may be applied to an array of difference values to generate transform coefficients. It should be noted that in ITU-T H.265 and JVET-P2001, a CU

is associated with a transform tree structure having its root at the CU level. The transform tree is partitioned into one or more transform units (TUs). That is, an array of difference values may be partitioned for purposes of generating transform coefficients (e.g., four 8×8 transforms may be applied to a 16×16 array of residual values). For each component of video data, such sub-divisions of difference values may be referred to as Transform Blocks (TBs). It should be noted that in some cases, a core transform and a subsequent secondary transforms may be applied (in the video encoder) to generate transform coefficients. For a video decoder, the order of transforms is reversed.

[0036] A quantization process may be performed on transform coefficients or residual sample values directly (e.g., in the case, of palette coding quantization). Quantization approximates transform coefficients by amplitudes restricted to a set of specified values. Quantization essentially scales transform coefficients in order to vary the amount of data required to represent a group of transform coefficients. Quantization may include division of transform coefficients (or values resulting from the addition of an offset value to transform coefficients) by a quantization scaling factor and any associated rounding functions (e.g., rounding to the nearest integer). Quantized transform coefficients may be referred to as coefficient level values. Inverse quantization (or “dequantization”) may include multiplication of coefficient level values by the quantization scaling factor, and any reciprocal rounding or offset addition operations. It should be noted that as used herein the term quantization process in some instances may refer to division by a scaling factor to generate level values and multiplication by a scaling factor to recover transform coefficients in some instances. That is, a quantization process may refer to quantization in some cases and inverse quantization in some cases. Further, it should be noted that although in some of the examples below quantization processes are described with respect to arithmetic operations associated with decimal notation, such descriptions are for illustrative purposes and should not be construed as limiting. For example, the techniques described herein may be implemented in a device using binary operations and the like. For example, multiplication and division operations described herein may be implemented using bit shifting operations and the like.

[0037] Quantized transform coefficients and syntax elements (e.g., syntax elements indicating a coding structure for a video block) may be entropy coded according to an entropy coding technique. An entropy coding process includes coding values of syntax elements using lossless data compression algorithms. Examples of entropy coding techniques include content adaptive variable length coding (CAVLC), context adaptive binary arithmetic coding (CABAC), probability interval partitioning entropy coding (PIPE), and the like. Entropy encoded quantized transform coefficients and corresponding entropy encoded syntax elements may form a compliant bitstream that can be used to reproduce video data at a video decoder. An entropy coding process, for example, CABAC, may include performing a binarization on syntax elements. Binarization refers to the process of converting a value of a syntax element into a series of one or more bits. These bits may be referred to as “bins.” Binarization may include one or a combination of the following coding techniques: fixed length coding, unary coding, truncated unary coding, truncated Rice coding, Golomb coding, k-th order exponential Golomb coding, and

Golomb-Rice coding. For example, binarization may include representing the integer value of 5 for a syntax element as 00000101 using an 8-bit fixed length binarization technique or representing the integer value of 5 as 11110 using a unary coding binarization technique. As used herein each of the terms fixed length coding, unary coding, truncated unary coding, truncated Rice coding, Golomb coding, k-th order exponential Golomb coding, and Golomb-Rice coding may refer to general implementations of these techniques and/or more specific implementations of these coding techniques. For example, a Golomb-Rice coding implementation may be specifically defined according to a video coding standard. In the example of CABAC, for a particular bin, a context provides a most probable state (MPS) value for the bin (i.e., an MPS for a bin is one of 0 or 1) and a probability value of the bin being the MPS or the least probable state (LPS). For example, a context may indicate, that the MPS of a bin is 0 and the probability of the bin being 1 is 0.3. It should be noted that a context may be determined based on values of previously coded bins including bins in the current syntax element and previously coded syntax elements. For example, values of syntax elements associated with neighboring video blocks may be used to determine a context for a current bin.

[0038] With respect to the equations used herein, the following arithmetic operators may be used:

[0039] + Addition

[0040] − Subtraction

[0041] Multiplication, including matrix multiplication

[0042] x^y Exponentiation. Specifies x to the power of y .

In other contexts, such notation is used for superscripting not intended for interpretation as exponentiation.

[0043] / Integer division with truncation of the result toward zero. For example, $7/4$ and $-7/-4$ are truncated to 1 and $-7/4$ and $7/-4$ are truncated to -1 .

[0044] \div Used to denote division in mathematical equations where no truncation or rounding is intended.

[0045] x/y Used to denote division in mathematical equations where no truncation or rounding is intended.

[0046] Further, the following mathematical functions may be used:

[0047] $\text{Log}_2(x)$ the base-2 logarithm of x ;

$$\text{Min}(x, y) = \begin{cases} x & ; \ x <= y \\ y & ; \ x > y \end{cases}$$

$$\text{Max}(x, y) = \begin{cases} x & ; \ x >= y \\ y & ; \ x < y \end{cases}$$

[0048] $\text{Ceil}(x)$ the smallest integer greater than or equal to x .

[0049] With respect to the example syntax used herein, the following definitions of logical operators may be applied:

[0050] $x \ \&\& \ y$ Boolean logical “and” of x and y

[0051] $x || y$ Boolean logical “or” of x and y

[0052] $!$ Boolean logical “not”

[0053] $x \ ?y : z$ If x is TRUE or not equal to 0, evaluates to the value of y ; otherwise, evaluates to the value of z .

[0054] Further, the following relational operators may be applied:

[0055] $>$ Greater than

[0056] $>=$ Greater than or equal to

[0057] $<$ Less than

[0058] $<=$ Less than or equal to

[0059] $==$ Equal to

[0060] $!=$ Not equal to

[0061] Further, it should be noted that in the syntax descriptors used herein, the following descriptors may be applied:

[0062] $b(8)$: byte having any pattern of bit string (8 bits). The parsing process for this descriptor is specified by the return value of the function $\text{read_bits}(8)$.

[0063] $f(n)$: fixed-pattern bit string using n bits written (from left to right) with the left bit first. The parsing process for this descriptor is specified by the return value of the function $\text{read_bits}(n)$.

[0064] $se(v)$: signed integer 0-th order Exp-Golomb-coded syntax element with the left bit first.

[0065] $tb(v)$: truncated binary using up to maxVal bits with maxVal defined in the semantics of the syntax element.

[0066] $tu(v)$: truncated unary using up to maxVal bits with maxVal defined in the semantics of the syntax element.

[0067] $u(n)$: unsigned integer using n bits. When n is “ v ” in the syntax table, the number of bits varies in a manner dependent on the value of other syntax elements. The parsing process for this descriptor is specified by the return value of the function $\text{read_bits}(a)$ interpreted as a binary representation of an unsigned integer with most significant bit written first.

[0068] $ue(v)$: unsigned integer 0-th order Exp-Golomb-coded syntax element with the left bit first.

[0069] As described above, video content includes video sequences comprised of a series of pictures and each picture may be divided into one or more regions. In JVET-P2001, a coded representation of a picture is referred to as a coded picture and all CTUs of the coded picture are encapsulated in one or more coded slice NAL units. That is, one or more corresponding coded slice NAL units encapsulate a coded representation of a picture. For example, referring again to FIG. 2, the coded representation of Pic_3 is encapsulated in three coded slice NAL units (i.e., Slice_0 NAL unit, Slice_1 NAL unit, and Slice_2 NAL unit). It should be noted that the term video coding layer (VCL) NAL unit is used as a collective term for coded slice NAL units, i.e., VCL NAL is a collective term which includes all types of slice NAL units. As described above, and in further detail below, a NAL unit may encapsulate metadata used for decoding video data. A NAL unit encapsulating metadata used for decoding a video sequence is generally referred to as a non-VCL NAL unit. Thus, in JVET-P2001, a NAL unit may be a VCL NAL unit or a non-VCL NAL unit. It should be noted that a VCL NAL unit includes slice header data, which provides information used for decoding the particular slice. Thus, in JVET-P2001, information used for decoding video data, which may be referred to as metadata in some cases, is not limited to being included in non-VCL NAL units. JVET-P2001 provides where a picture unit (PU) is a set of NAL units that contain all VCL NAL units of a coded picture and their associated non-VCL NAL units and where an access unit (AU) is a set of NAL units that are associated with each other according to a specified classification rule, are consecutive in decoding order, and contain exactly one coded picture for each present picture unit. A PU consists of one picture header NAL unit, one coded picture, which comprises of one or more VCL NAL units, and zero or more non-VCL NAL units. Thus, in JVET-P2001 an access unit includes one or more coded

pictures. In some cases, an access unit may include pictures included in different layers of video. Layers of video are described in further detail below. Further, in JVET-P2001, a coded video sequence (CVS) is a sequence of AUs that consists, in decoding order, of a CVSS AU, followed by zero or more AUs that are not CVSS AUs, including all subsequent AUs up to but not including any subsequent AU that is a CVSS AU, where a coded video sequence start (CVSS) AU is an AU in which there is a picture unit for each layer in the CVS and the coded picture in each present picture unit is a coded layer video sequence start (CLVSS) picture. In JVET-P2001, a coded layer video sequence (CLVS) is a sequence of PUs within the same layer that consists, in decoding order, of a CLVSS PU, followed by zero or more PUs that are not CLVSS PUs, including all subsequent PUs up to but not including any subsequent PU that is a CLVSS PU. This is, in JVET-P2001, a bitstream may be described as including a sequence of NAL units forming a CVS, where a CVS includes AUs and each AU may include respective pictures for each of a plurality of layers for coded video.

[0070] Multi-layer video coding enables a video presentation to be decoded/displayed as a presentation corresponding to a base layer of video data and decoded/displayed one or more additional presentations corresponding to enhancement layers of video data. For example, a base layer may enable a video presentation having a basic level of quality (e.g., a High Definition rendering and/or a 30 Hz frame rate) to be presented and an enhancement layer may enable a video presentation having an enhanced level of quality (e.g., an Ultra High Definition rendering and/or a 60 Hz frame rate) to be presented. An enhancement layer may be coded by referencing a base layer. That is, for example, a picture in an enhancement layer may be coded (e.g., using inter-layer prediction techniques) by referencing one or more pictures (including scaled versions thereof) in a base layer. It should be noted that layers may also be coded independent of each other. In this case, there may not be inter-layer prediction between two layers. Each NAL unit may include an identifier indicating a layer of video data the NAL unit is associated with. As described above, a sub-bitstream extraction process may be used to only decode and display a particular region of interest of a picture. Further, a sub-bitstream extraction process may be used to only decode and display a particular layer of video. Sub-bitstream extraction may refer to a process where a device receiving a compliant or conforming bitstream forms a new compliant or conforming bitstream by discarding and/or modifying data in the received bitstream. For example, sub-bitstream extraction may be used to form a new compliant or conforming bitstream corresponding to a particular representation of video (e.g., a high quality representation).

[0071] In JVET-P2001, each of a video sequence, a GOP, a picture, a slice, and CTU may be associated with metadata that describes video coding properties and some types of metadata are encapsulated in non-VCL NAL units. JVET-P2001 defines parameter sets that may be used to describe video data and/or video coding properties. In particular, JVET-P2001 includes the following five types of parameter sets: decoding parameter set (DPS), video parameter set (VPS), sequence parameter set (SPS), picture parameter set (PPS), and adaption parameter set (APS), where a SPS applies to apply to zero or more entire CVSs, a PPS applies to zero or more entire coded pictures, a APS applies to zero or more slices, and a DPS and a VPS may be optionally

referenced by a SPS. A PPS applies to an individual coded picture that refers to it. In JVET-P2001, parameter sets may be encapsulated as a non-VCL NAL unit and/or may be signaled as a message. JVET-P2001 also includes a picture header (PH) which is encapsulated as a non-VCL NAL unit. In JVET-P2001, a picture header applies to all slices of a coded picture. JVET-P2001 further enables supplemental enhancement information (SEI) messages to be signaled. In JVET-P2001, SEI messages assist in processes related to decoding, display or other purposes, however, SEI messages may not be required for constructing the luma or chroma samples according to a decoding process. In JVET-P2001, SEI messages may be signaled in a bitstream using non-VCL NAL units. Further, SEI messages may be conveyed by some mechanism other than by being present in the bitstream (i.e., signaled out-of-band).

[0072] FIG. 3 illustrates an example of a bitstream including multiple CVSs, where a CVS includes AUs, and AUs include picture units. The example illustrated in FIG. 3 corresponds to an example of encapsulating the slice NAL units illustrated in the example of FIG. 2 in a bitstream. In the example illustrated in FIG. 3, the corresponding picture unit for Pic₃ includes the three VCL NAL coded slice NAL units, i.e., Slice₀ NAL unit, Slice₁ NAL unit, and Slice₂ NAL unit and two non-VCL NAL units, i.e., a PPS NAL Unit and a PH NAL unit. It should be noted that in FIG. 3, HEADER is a NAL unit header (i.e., not to be confused with a slice header). Further, it should be noted that in FIG. 3, other non-VCL NAL units, which are not illustrated may be included in the CVSs, e.g., SPS NAL units, VPS NAL units, SEI message NAL units, etc. Further, it should be noted that in other examples, a PPS NAL Unit used for decoding Pic₃ may be included elsewhere in the bitstream, e.g., in the picture unit corresponding to Pic₀ or may be provided by an external mechanism. However, it should be noted that in JVET-P2001, the picture header for each picture is required to be in the picture unit corresponding to the picture.

[0073] JVET-P2001 defines NAL unit header semantics that specify the type of Raw Byte Sequence Payload (Rbsp) data structure included in the NAL unit. Table 1 illustrates the syntax of the NAL unit header provided in JVET-P2001

TABLE 1

Descriptor	
<code>nal_unit_header() {</code>	
<code>forbidden_zero_bit</code>	<code>f(1)</code>
<code>nuh_reserved_zero_bit</code>	<code>u(1)</code>
<code>nuh_layer_id</code>	<code>u(6)</code>
<code>nal_unit_type</code>	<code>u(5)</code>
<code>nuh_temporal_id_plus1</code>	<code>u(3)</code>
<code>}</code>	

[0074] JVET-P2001 provides the following definitions for the respective syntax elements illustrated in Table 1.

[0075] `forbidden_zero_bit` shall be equal to 0,

[0076] `nuh_reserved_zero_bit` shall be equal to '0' The value 1 of `nuh_reserved_zero_bit` may be specified in the future by ITU-T/ISO/IEC. Decoders shall ignore (i.e. remove from the bitstream and discard) NAL units with `nuh_reserved_zero_bit` equal to '1'.

[0077] `nuh_layer_id` specifies the identifier of the layer to which a VCL NAL unit belongs or the identifier of a layer to which a non-VCL NAL unit applies. The

value of `nuh_layer_id` shall be in the range of 0 to 55, inclusive. Other values for `nuh_layer_id` are reserved for future use by ITU-T | ISO/IEC.

[0078] The value of `nuh_layer_id` shall be the same for all VCL NAL units of a coded picture. The value of `nuh_layer_id` of a coded picture or a PU is the value of the `nuh_layer_id` of the VCL NAL units of the coded picture or the PU.

[0079] The value of `nuh_layer_id` for non-VCL NAL units is constrained as follows:

[0080] If `nal_unit_type` is equal to PPS_NUT, PREFIX_APS_NUT, or SUFFIX_APS_NUT, `nuh_layer_id` shall be equal to the lowest `nuh_layer_id` value of the coded slice NAL units that refer to the NAL unit.

[0081] Otherwise, if `nal_unit_type` is equal to SPS_NUT, `nuh_layer_id` shall be equal to the lowest `nuh_layer_id` value of the PPS NAL units that refer to the SPS NAL unit.

[0082] Otherwise, if `nal_unit_type` is equal to AUD_NUT, `nuh_layer_id` shall be equal to `vps_layer_id[0]`.

[0083] Otherwise, when `nal_unit_type` is equal to PH_NUT, EOS_NUT, or FD_NUT, `nuh_layer_id` shall be equal to the `nuh_layer_id` of associated VCL NAL unit.

[0084] NOTE—The value of `nuh_layer_id` of DPS, VPS, and EOB NAL units is not constrained.

[0085] The value of `nal_unit_type` shall be the same for all pictures of a CVSS AU.

[0086] `nuh_temporal_id_plus1` minus 1 specifies a temporal identifier for the NAL unit.

[0087] The value of `nuh_temporal_id_plus1` shall not be equal to 0.

[0088] The variable `TemporalId` is derived as follows:

$$\text{TemporalId} = \text{nuh_temporal_id_plus1} - 1$$

[0089] When `nal_unit_type` is in the range of IDR_W_RADL to RSV_IRAP_12, inclusive, `TemporalId` shall be equal to 0.

[0090] When `nal_unit_type` is equal to STSA_NUT, `TemporalId` shall not be equal to 0.

[0091] The value of `TemporalId` shall be the same for all VCL NAL units of an AU. The value of `TemporalId` of a coded picture, a PU, or an AU is the value of the `TemporalId` of the VCL NAL units of the coded picture, PU, or AU. The value of `TemporalId` of a sublayer representation is the greatest value of `TemporalId` of all VCL NAL units in the sublayer representation.

[0092] The value of `TemporalId` for non-VCL NAL units is constrained as follows:

[0093] If `nal_unit_type` is equal to DPS_NUT, VPS_NUT, or SPS_NUT `TemporalId` shall be equal to 0 and the `TemporalId` of the AU containing the NAL unit shall be equal to 0.

[0094] Otherwise, if `nal_unit_type` is equal to PH_NUT, `TemporalId` shall be equal to the `TemporalId` of the PU containing the NAL unit.

[0095] Otherwise, if `nal_unit_type` is equal to EOS_NUT or EOB_NUT, `TemporalId` shall be equal to 0.

[0096] Otherwise, if `nal_unit_type` is equal to AUD_NUT, FD_NUT, PREFIX_SEI_NUT, or SUFFIX_SEI_NUT `TemporalId` shall be equal to the `TemporalId` of the AU containing the NAL unit.

[0097] Otherwise when `nal_unit_type` is equal to PPS_NUT, PREFIX_APS_NUT, or SUFFIX_APS_NUT, `TemporalId` shall be greater than or equal to the `TemporalId` of the PU containing the NAL unit.

[0098] NOTE—When the NAL unit is a non-VCL NAL unit, the value of `TemporalId` is equal to the minimum value of the `TemporalId` values of all AUs to which the non-VCL NAL unit applies. When `nal_unit_type` is equal to PPS_NUT, PREFIX_APS_NUT, or SUFFIX_APS_NUT, `TemporalId` may be greater than or equal to the `TemporalId` of the containing AU, as all PPSs and APSs may be included in the beginning of the bitstream (e.g., when they are transported out-of-band, and the receiver places them at the bitstream), wherein the first coded picture has `TemporalId` equal to 0.

[0099] `nal_unit_type` specifies the NAL unit type, i.e., the type of RBSP data structure contained in the NAL unit as specified in Table 2.

[0100] NAT units that have `nal_unit_type` in the range of UNSPEC28..UNSPEC31, inclusive, for which semantics are not specified, shall not affect the decoding process specified in this Specification.

[0101] NOTE—NAL unit types in the range of UNSPEC_28..UNSPEC31 may be used as determined by the application. No decoding process for these values of `nal_unit_type` is specified in this Specification. Since different applications might use these NAL unit types for different purposes, particular care must be exercised in the design of encoders that generate NAL units with these `nal_unit_type` values, and in the design of decoders that interpret the content of NAL units with these `nal_unit_type` values. This Specification does not define any management for these values. These `nal_unit_type` values might only be suitable for use in contexts in which “collisions” of usage (i.e., different definitions of the meaning of the NAL unit content for the same `nal_unit_type` value) are unimportant, or not possible, or are managed—e.g. defined or managed in the controlling application or transport specification, or by controlling the environment in which bitstreams are distributed.

[0102] For purposes other than determining the amount of data in the decoding units of the bitstream, decoders shall ignore (remove from the bitstream and discard) the contents of all NAL units that use reserved values of `nal_unit_type`.

[0103] NOTE—This requirement allows future definition of compatible extensions to this Specification.

TABLE 2

nal_unit_type	Name of nal_unit_type	Content of NAL unit and RBSP syntax structure	NAL unit type class
0	TRAIL_NUT	Coded slice of a trailing picture slice_layer_rbsp()	VCL
1	STSA_NUT	Coded slice of an STSA picture slice_layer_rbsp()	VCL
2	RADL_NUT	Coded slice of a RADL picture slice_layer_rbsp()	VCL
3	RASL_NUT	Coded slice of a RASL picture slice_layer_rbsp()	VCL
4 . . . 6	RSV_VCL_4 . . . RSV_VCL_6	Reserved non-IRAP VCL NAL unit types	VCL
7	IDR_W_RADL	Coded slice of an IDR picture slice_layer_rbsp()	VCL
8	IDR_N_LP	Coded slice of an IDR picture slice_layer_rbsp()	VCL
9	CRA_NUT	Coded slice of a CRA picture silce_layer_rbsp()	VCL
10	GDR_NUT	Coded slice of a GDR picture slice_layer_rbsp()	VCL
11	RSV_IRAP_11	Reserved IRAP VCL NAL unit types	VCL
12	RSV_IRAP_12	Reserved IRAP VCL NAL unit types	VCL
13	DPS_NUT	Decoding parameter set decoding_parameter_set_rbsp()	non-VCL
14	VPS_NUT	Video parameter set video_parameter_set_rbsp()	non-VCL
15	SPS_NUT	Sequence parameter set seq_parameter_set_rbsp()	non-VCL
16	PPS_NUT	Picture parameter set pic_parameter_set_rbsp()	non-VCL
17	PREFIX_APS_NUT	Adaptation parameter set adaptation_parameter_set_rbsp()	non-VCL
18	SUFFIX_APS_NUT	Adaptation parameter set adaptation_parameter_set_rbsp()	non-VCL
19	PH_NUT	Picture header picture_header_rbsp()	non-VCL
20	AUD_NUT	AU delimiter access_unit_delimiter_rbsp()	non-VCL
21	EOS_NUT	End of sequence end_of_seq_rbsp()	non-VCL
22	EOB_NUT	End of bitstream end_of_bitstream_rbsp()	non-VCL
23	PREFIX_SEI_NUT	Supplemental enhancement information sei_rbsp()	non-VCL
24	SUFFIX_SEI_NUT	Supplemental enhancement information sei_rbsp()	non-VCL
25	FD_NUT	Filler data filler_data_rbsp()	non-VCL
26	RSV_NVCL_26	Reserved non-VCL NAL unit types	non-VCL
27	RSV_NVCL_27	Reserved non-VCL NAL unit types	non-VCL
28 . . . 31	UNSPEC_28 . . . UNSPEC_31	Unspecified non-VCL NAL unit types	non-VCL

[0104] NOTE—A clean random access (CRA) picture may have associated RASL or RADL pictures present in the bitstream.

[0105] NOTE—An instantaneous decoding refresh (IDR) picture having nal_unit_type equal to IDR_N_LP does not have associated leading pictures present in the bitstream. An IDR picture having nal_unit_type equal to IDR_W_RADL does not have associated RASL pictures present in the bitstream, but may have associated RADL pictures in the bitstream.

[0106] For VCL NAL units of any particular picture, the following applies:

[0107] If mixed_nalu_types_in_pic_flag is equal to 0, the value of nal_unit_type shall be the same for all coded slice NAL units of a picture. A picture or a PU is referred to as having the same NAL unit type as the coded slice NAL units of the picture or PU.

[0108] Otherwise (mixed_nalu_types_in_pic_flag equal to 1), one or more of the VCL NAL units shall all have a particular value of nal_unit_type in the range of IDR_W_RADL to CRA_NUT, inclusive, and the other VCL NAL units shall all have a

particular value of nal_unit_type in the range of TRAIL_NUT to RSV_VCL_6, inclusive, or equal to GRA_NUT.

[0109] For a single-layer Bitstream, the following constraints apply:

[0110] Each picture, other than the first picture in the Bitstream in decoding order, is considered to be associated with the previous IRAP picture in decoding order.

[0111] When a picture is a leading picture of an IRAP picture, it shall be a RADL or RASL picture.

[0112] When a picture is a trailing picture of an IRAP picture, it shall not be a RADL or RASL picture.

[0113] No RASL pictures shall be present in the bitstream that are associated with an IDR picture.

[0114] No RADL pictures shall be present in the bitstream that are associated with an IDR picture having nal_unit_type equal to IDR_N_LP.

[0115] NOTE—It is possible to perform random access a the position of an IRAP PU by discarding all PUs before the IRAP PU (and to correctly decode the IRAP picture and all the subsequent non-RASL

pictures in decoding order), provided each parameter set is available (either in the bitstream or by external means not specified in this Specification)

[0116] Any picture that precedes an IRAP picture in decoding order shall precede the IRAP picture in output order and shall precede any RADL picture associated with the IRAP picture in output order.

[0117] Any RASL picture associated with a CRA picture shall precede any RADL picture associated with the CRA picture in output order.

[0118] Any RASL picture associated with a CRA picture shall follow, in output order, any TRAP picture that precedes the CRA picture in decoding order.

[0119] If field_seq_flag is equal to 0 and the current picture is a leading picture associated with an IRAP picture, it shall precede in decoding order, all non-leading pictures that are associated with the same IRAP picture. Otherwise, let picA and picB be the first and the last leading pictures, in decoding order, associated with an IRAP picture, respectively, there shall be at most one non-leading picture preceding picA in decoding order, and there shall be no non-leading picture between picA and picB in decoding order.

[0120] It should be noted that generally, an Intra Random Access Point (IRAP) picture is a picture that does not refer to any pictures other than itself for prediction in its decoding process. In JVET-P2001, an IRAP picture may be a clean random access (CRA) picture or an instantaneous decoder refresh (IDR) picture. In JVET-P2001, the first picture in the bitstream in decoding order must be an IRAP or a gradual

decoding refresh (GDR) picture. JVET-P2001 describes the concept of a leading picture, which is a picture that precedes the associated IRAP picture in output order. JVET-P2001 further describes the concept of a trailing picture which is a non-IRAP picture that follows the associated IRAP picture in output order. Trailing pictures associated with an IRAP picture also follow the IRAP picture in decoding order. For IDR pictures, there are no trailing pictures that require reference to a picture decoded prior to the IDR picture. JVET-P2001 provides where a CRA picture may have leading pictures that follow the CRA picture in decoding order and contain inter picture prediction references to pictures decoded prior to the CRA picture. Thus, when the CRA picture is used as a random access point these leading pictures may not be decodable and are identified as random access skipped leading (RASL) pictures. The other type of picture that can follow an IRAP picture in decoding order and precede it in output order is the random access decodable leading (RADL) picture, which cannot contain references to any pictures that precede the IRAP picture in decoding order. A GDR picture, is a picture for which each VCL NAL unit has nal_unit_type equal to GDR_NUT. If the current picture is a GDR picture that is associated with a picture header which signals a syntax element recovery_poc_cnt and there is a picture picA that follows the current GDR picture in decoding order in the CLVS and that has PicOrderCntVal equal to the PicOrderCntVal of the current GDR picture plus the value of recovery_poc_cnt, the picture picA is referred to as the recovery point picture.

[0121] As provided in Table 2, a NAL unit may include a sequence parameter set syntax structure. Table 3 illustrates the syntax structure of the SPS provided in JVET-P2001.

[0122] With respect to Table 3, JVET-P2001 provides the following semantics:

[0123] An SPS RBSP shall be available to the decoding process prior to it being referenced, included in at least one AU with TemporalId equal to 0 or provided through external means.

[0124] All SPS NAL units with a particular value of sps_seq_parameter_set_id in a CVS shall have the same content.

[0125] sps_decoding_parameter_set_id, when greater than 0, specifies the value of dps_decoding_parameter_set_id for the DPS referred to by the SPS. When sps_decoding_parameter_set_id is equal to 0, the SPS does not refer to a DPS and no DPS is referred to when decoding each CLVS referring to the SPS. The value of sps_decoding_parameter_set_id shall be the same in all SPSs that are referred to by coded pictures in a bitstream.

[0126] sps_video_parameter_set_id, when greater than 0, specifies the value of vps_video_parameter_set_id for the VPS referred to by the SPS.

[0127] When sps_video_parameter_set_id is equal to 0, the following applies:

[0128] The SPS does not refer to a VPS.

[0129] No VPS is referred to when decoding each CLVS referring to the SPS.

[0130] The value of vps_max_layers_minus1 is inferred to be equal to 0.

[0131] The CVS shall contain only one layer (i.e., all VCL NAL unit in the CVS shall have the same value of nuh_layer_id).

[0132] The value of GeneralLayerIdx[nuh_layer_id] is inferred to be equal to 0.

[0133] The value of vps_independent_layer_flag[GeneralLayerIdx[nuh_layer_id]] is inferred to be equal to 1.

[0134] When vps_independent_layer_flag[GeneralLayerIdx[nuh_layer_id]] is equal to 1, the SPS referred to by a CLVS with a particular nuh_layer_id value nuhLayerId shall have nuh_layer_id equal to nuhLayerId.

[0135] sps_max_sublayers_minus1 plus 1 specifies the maximum number of temporal sublayers that may be present in each CLVS referring to the SPS. The value of sps_max_sublayers_minus1 shall be in the range of 0 to vps_max_sublayers_minus1, inclusive.

[0136] sps_reserved_zero_4 bits shall be equal to 0 in bitstreams conforming to this version of this Specification. Other values for sps_reserved_zero_4 bits are reserved for future use by ITU-T/ISO/IEC.

[0137] sps_ptl_dpb_hrd_params_present_flag equal to 1 specifies that a profile_tier_level() syntax structure and a dpb_parameters() syntax structure are present in the SPS, and a general_hrd_parameters() syntax structure and an ols_hrd_parameters() syntax structure may also be present in the SPS. sps_ptl_dpb_hrd_params_present_flag equal to 0 specifies that none of these syntax structures is present in the SPS. The value of sps_ptl_dpb_hrd_params_present_flag shall be equal to vps_independent_layer_flag[nuh_layer_id].

[0138] If vps_independent_layer_flag[GeneralLayerIdx[nuh_layer_id]] is equal to 1, the variable MaxDecPicBuffMinus1 is set equal to max_dec_pic_buffering_minus1[sps_max_sublayers_minus1] in the dpb_parameters() syntax structure in the Otherwise, MaxDecPicBuffMinus1 is set SPS. equal to in the max_dec_pic_buffering_minus1[sps_max_sublayers_minus1] layer_nonoutput_dpb_params_idx[GeneralLayerIdx[nuh_layer_id]]-th dpb_parameters() syntax structure in the VPS.

[0139] gdr_enabled_flag equal to 1 specifies that GDR pictures may be present in CLVSs referring to the SPS. gdr_enabled_flag equal to 0 specifies that GDR pictures are not present in CLVSs referring to the SPS.

[0140] sps_seq_parameter_set_id provides an identifier for the SPS for reference by other syntax elements.

[0141] SPS NAL units, regardless of the nuh_layer_id values, share the same value space of sps_seq_parameter_set_id.

[0142] chroma_format_idc specifies the chroma sampling relative to the luma sampling as specified.

[0143] separate_colour_plane_flag equal to 1 specifies that the three colour components of the 4:4:4 chroma format are coded separately. separate_colour_plane_flag equal to 0 specifies that the colour components are not coded separately. When separate_colour_plane_flag is not present, it is inferred to be equal to 0. When separate_colour_plane_flag is equal to 1, the coded picture consists of three separate components, each of which consists of coded samples of one colour plane (Y, Cb, or Cr) and uses the monochrome coding syntax.

In this case, each colour plane is associated with a specific `colour_plane_id` value.

[0144] NOTE—There is no dependency in decoding processes between the colour planes having different `colour_plane_id` values. For example, the decoding process of a monochrome picture with one value of `colour_plane_id` does not use any data from monochrome pictures having different values of `colour_plane_id` for inter prediction.

[0145] Depending on the value of `separate_colour_plane_flag`, the value of the variable `ChromaArrayType` is assigned as follows:

[0146] If `separate_colour_plane_flag` is equal to 0, `ChromaArrayType` is set equal to `chroma_format_idc`.

[0147] Otherwise (`separate_colour_plane_flag` is equal to 1), `ChromaArrayType` is set equal to 0.

[0148] `ref_pic_resampling_enabled_flag` equal to 1 specifies that reference picture resampling may be applied when decoding coded pictures in the CLVSs referring to the SPS. `ref_pic_resampling_enabled_flag` equal to 0 specifies that reference picture resampling is not applied when decoding pictures in CLVSs referring to the SPS.

[0149] `pic_width_max_in_luma_samples` specifies the maximum width, in units of luma samples, of each decoded picture referring to the SPS. `pic_width_max_in_luma_samples` shall not be equal to 0 and shall be an integer multiple of $\text{Max}(8, \text{MinCbSizeY})$.

[0150] `pic_height_max_in_luma_samples` specifies the maximum height, in units of luma samples, of each decoded picture referring to the SPS. `pic_height_max_in_luma_samples` shall not be equal to 0 and shall be an integer multiple of $\text{Max}(8, \text{MinCbSizeY})$.

[0151] `sps_log_2_ctu_size_minus5` plus 5 specifies the luma coding tree block size of each CTU. It is a requirement of bitstream conformance that the value of `sps_log_2_ctu_size_minus5` be less than or equal to 2.

[0152] The variables `CtbLog2SizeY` and `CtbSizeY` are derived as follows:

$$\text{CtbLog2SizeY} = \text{sps_log2_ctu_size_minus5} + 5$$

$$\text{CtbSizeY} = 1 \ll \text{CtbLog2SizeY}$$

[0153] `subpics_present_flag` equal to 1 specifies that subpicture parameters are present in the SPS RBSP syntax. `subpics_present_flag` equal to 0 specifies that subpicture parameters are not present in the SPS RBSP syntax.

[0154] NOTE—When a bitstream is the result of a sub-bitstream extraction process and contains only a subset of the subpictures of the input bitstream to the sub-bitstream extraction process, it might be required to set the value of `subpics_present_flag` equal to 1 in the RBSP of the SPSs.

[0155] `sps_num_subpics_minus1` plus 1 specifies the number of subpictures. `sps_num_subpics_minus1` shall be in the range of 0 to 254. When not present, the value of `sps_num_subpics_minus1` is inferred to be equal to 0.

[0156] `subpic_ctu_top_left_x[i]` specifies horizontal position of top left CTU of *i*-th subpicture in unit of

`CtbSizeY`. The length of the syntax element is $\text{Ceil}(\text{Log}_2(\text{pic_width_max_in_luma_samples}/\text{CtbSizeY}))$ bits. When not present, the value of `subpic_ctu_top_left_x[i]` is inferred to be equal to 0.

[0157] `subpic_ctu_top_left_y[i]` specifies vertical position of top left CTU of *i*-th subpicture in unit of `CtbSizeY`. The length of the syntax element is $\text{Ceil}(\text{Log}_2(\text{pic_height_max_in_luma_samples}/\text{CtbSizeY}))$ bits. When not present, the value of `subpic_ctu_top_left_y[i]` is inferred to be equal to 0.

[0158] `subpic_width_minus1[i]` plus 1 specifies the width of the *i*-th subpicture in units of `CtbSizeY`. The length of the syntax element is $\text{Ceil}(\text{Log}_2(\text{pic_width_max_in_luma_samples}/\text{CtbSizeY}))$ bits. When not present, the value of `subpic_width_minus1[i]` is inferred to be equal to $\text{Ceil}(\text{pic_width_max_in_luma_samples}/\text{CtbSizeY}) - 1$.

[0159] `subpic_height_minus1[i]` plus 1 specifies the height of the *i*-th subpicture in units of `CtbSizeY`. The length of the syntax element is $\text{Ceil}(\text{Log}_2(\text{pic_height_max_in_luma_samples}/\text{CtbSizeY}))$ bits. When not present, the value of `subpic_height_minus1[i]` is inferred to be equal to $\text{Ceil}(\text{pic_height_max_in_luma_samples}/\text{CtbSizeY}) - 1$.

[0160] `subpic_treated_as_pic_flag[i]` equal to 1 specifies that the *i*-th subpicture of each coded picture in the CLVS is treated as a picture in the decoding process excluding in-loop filtering operations. `subpic_treated_as_pic_flag[i]` equal to 0 specifies that the *i*-th subpicture of each coded picture in the CLVS is not treated as a picture in the decoding process excluding in-loop filtering operations. When not present, the value of `subpic_treated_as_pic_flag[i]` is inferred to be equal to 0.

[0161] `loop_filter_across_subpic_enabled_flag[i]` equal to 1 specifies that in-loop filtering operations may be performed across the boundaries of the *i*-th subpicture in each coded picture in the CLVS. `loop_filter_across_subpic_enabled_flag[i]` equal to 0 specifies that in-loop filtering operations are not performed across the boundaries of the *i*-th subpicture in each coded picture in the CLVS. When not present, the value of `loop_filter_across_subpic_enabled_flag[i]` is inferred to be equal to 1.

[0162] It is a requirement of bitstream conformance that the following constraints apply:

[0163] 1 For any two subpictures `subpicA` and `subpicB`, when the subpicture index of `subpicA` is less than that of `subpicB`, any coded slice NAL unit of `subpicA` shall precede any coded slice NAL unit of `subpicB` in decoding order.

[0164] The shapes of the subpictures shall be such that each subpicture, when decoded, shall have its entire left boundary and entire top boundary consisting of picture boundaries or consisting of boundaries of previously decoded subpictures.

[0165] `sps_subpic_id_present_flag` equal to 1 specifies that subpicture ID mapping is present in the SPS. `sps_subpic_id_present_flag` equal to 0 specifies that subpicture ID mapping is not present in the SPS.

[0166] `sps_subpic_id_signalling_present_flag` equal to 1 specifies that subpicture ID mapping is signalled in the SPS. `sps_subpic_id_signalling_present_flag` equal to 0 specifies that subpicture ID mapping is not sig-

nalled in the SPS. When not present, the value of `sps_subpic_id_signalling_present_flag` is inferred to be equal to 0.

[0167] `sps_subpic_id_len_minus1` plus 1 specifies the number of bits used to represent the syntax element `sps_subpic_id[i]`. The value of `sps_subpic_id_len_minus1` shall be in the range of 0 to 15, inclusive.

[0168] `sps_subpic_id[i]` specifies that subpicture ID of the *i*-th subpicture. The length of the `sps_subpic_id[i]` syntax element is `sps_subpic_id_len_minus1+1` bits. When not present, and when `sps_subpic_id_present_flag` equal to 0, the value of `sps_subpic_id[i]` is inferred to be equal to *i*, for each *i* in the range of 0 to `sps_num_subpics_minus1`, inclusive.

[0169] `bit_depth_minus8` specifies the bit depth of the samples of the luma and chroma arrays, `BitDepth`, and the value of the luma and chroma quantization parameter range offset, `QpBdOffset`, as follows:

$$\text{BitDepth} = 8 + \text{bit_depth_minus8}$$

$$\text{QpBdOffset} = 6 * \text{bit_depth_minus8}$$

[0170] `bit_depth_minus8` shall be in the range of 0 to 8, inclusive.

[0171] `min_qp_prime_ts_minus4` specifies the minimum allowed quantization parameter for transform skip mode as follows:

$$\text{QpPrimeTsMin} = 4 + \text{min_qp_prime_ts_minus4}$$

[0172] The value of `min_qp_prime_ts_minus4` shall be in the range of 0 to 48, inclusive.

[0173] `sps_weighted_pred_flag` equal to 1 specifies that weighted prediction may be applied to P slices referring to the SPS. `sps_weighted_pred_flag` equal to 0 specifies that weighted prediction is not applied to P slices referring to the SPS.

[0174] `sps_weighted_bipred_flag` equal to 1 specifies that explicit weighted prediction may be applied to B slices referring to the SPS. `sps_weighted_bipred_flag` equal to 0 specifies that explicit weighted prediction is not applied to B slices referring to the SPS.

[0175] `log_2_max_pic_order_cnt_lsb_minus4` specifies the value of the variable `MaxPicOrderCntLsb` that is used in the decoding process for picture order count as follows:

$$\text{MaxPicOrderCntLsb} = 2^{(\log_2_max_pic_order_cnt_lsb_minus4+4)}$$

[0176] The value of `log_2_max_pic_order_cnt_lsb_minus4` shall be in the range of 0 to 12, inclusive.

[0177] `sps_poc_msb_flag` equal to 1 specifies that the `ph_poc_msb_cycle_present_flag` syntax element is present in PHs referring to the SPS. `sps_poc_msb_flag` equal to 0 specifies that the `ph_poc_msb_cycle_present_flag` syntax element is not present in PHs referring to the SPS.

[0178] `poc_msb_len_minus1` plus 1 specifies the length, in bits, of the `poc_msb_val` syntax elements, when present in the PHs referring to the SPS. The value of `poc_msb_len_minus1` shall be in the range of 0 to $32 - \log_2_max_pic_order_cnt_lsb_minus4 - 5$, inclusive.

[0179] `sps_sublayer_dpb_params_flag` is used to control the presence of `max_num_reorder_pics[i]`, `max_dec_pic_buffering_minus1[i]`, and `max_latency_increase_plus1[i]` syntax elements in the `dpb_parameters()` syntax structure in the SPS. When not present, the value of `sps_sub_dpb_params_info_present_flag` is inferred to be equal to 0.

[0180] `long_term_ref_pics_flag` equal to 0 specifies that no LTRP is used for inter prediction of any coded picture in the CLVS. `long_term_ref_pics_flag` equal to 1 specifies that LTRPs may be used for inter prediction of one or more coded pictures in the CLVS.

[0181] `inter_layer_ref_pics_present_flag` equal to 0 specifies that no ILRP is used for inter prediction of any coded picture in the CLVS. `inter_layer_ref_pics_flag` equal to 1 specifies that ILRPs may be used for inter prediction of one or more coded pictures in the CLVS. When `sps_video_parameter_set_id` is equal to 0, the value of `inter_layer_ref_pics_present_flag` is inferred to be equal to 0. When `vps_independent_layer_flag` [`GeneralLayerIdx`[`nuh_layer_id`]] is equal to 1, the value of `inter_layer_ref_pics_present_flag` shall be equal to 0.

[0182] `sps_idr_rpl_present_flag` equal to 1 specifies that reference picture list syntax elements are present in slice headers of IDR pictures. `sps_idr_rpl_present_flag` equal to 0 specifies that reference picture list syntax elements are not present in slice headers of IDR pictures.

[0183] `rpl1_same_as_rpl0_flag` equal to 1 specifies that the syntax element `num_ref_pic_lists_in_sps[1]` and the syntax structure `ref_pic_list_struct(1, rplIdx)` are not present and the following applies:

[0184] The value of `num_ref_pic_lists_in_sps[1]` is inferred to be equal to the value of `num_ref_pic_lists_in_sps[0]`.

[0185] The value of each of syntax elements in `ref_pic_list_struct(1, rplIdx)` is inferred to be equal to the value of corresponding syntax element in `ref_pic_list_struct(0, rplIdx)` for `rplIdx` ranging from 0 to `num_ref_pic_lists_in_sps[0]-1`.

[0186] `num_ref_pic_lists_in_sps[i]` specifies the number of the `ref_pic_list_struct(listIdx, rplIdx)` syntax structures with `listIdx` equal to *i* included in the SPS. The value of `num_ref_pic_lists_in_sps[i]` shall be in the range of 0 to 64, inclusive.

[0187] NOTE—For each value of `listIdx` (equal to 0 or 1), a decoder should allocate memory for a total number of `num_ref_pic_lists_in_sps[i]+1` `ref_pic_list_struct(listIdx, rplIdx)` syntax structures since there may be one `ref_pic_list_struct(listIdx, rplIdx)` syntax structure directly signalled in the slice headers of a current picture.

[0188] `qtbtt_dual_tree_intra_flag` equal to 1 specifies that for I slices, each CTU is split into coding units with 64×64 luma samples using an implicit quadtree split and that these coding units are the root of two separate coding tree syntax structure for luma and chroma. `qtbtt_dual_tree_intra_flag` equal to 0 specifies separate

coding_tree syntax structure is not used for I slices. When qtbt_dual_tree_intra_flag is not present, it is inferred to be equal to 0.

[0189] $\log_2_min_luma_coding_block_size_minus2$ plus 2 specifies the minimum luma coding block size. The value range of $\log_2_min_luma_coding_block_size_minus2$ shall be in the range of 0 to $\log_2_ctu_size_minus5+3$, inclusive.

[0190] The variables $MinCbLog_2SizeY$, $MinCbSizeY$, $IbcBufWidthY$, $IbcBufWidthC$ and $VSize$ are derived as follows:

$$MinCbLog2SizeY = \log_2_min_luma_coding_block_size_minus2 + 2$$

$$MinCbSizeY = 1 << MinCbLog2SizeY$$

$$IbcBufWidthY = 256 * 128 / CtbSizeY$$

$$IbcBufWidthC = IbcBufWidthY / SubWidthC$$

$$VSize = \text{Min}(64, CtbSizeY)$$

[0191] The value of $MinCbSizeY$ shall less than or equal to $VSize$.

[0192] The variables $CtbWidthC$ and $CtbHeightC$, which specify the width and height, respectively, of the array for each chroma CTB, are derived as follows:

[0193] If $chroma_format_jde$ is equal to 0 (monochrome) or $separate_colour_plane_flag$ is equal to 1, $CtbWidthC$ and $CtbHeightC$ are both equal to 0.

[0194] Otherwise, $CtbWidthC$ and $CtbHeightC$ are derived as follows:

$$CtbWidthC = CtbSizeY / SubWidthC$$

$$CtbHeightC = CtbSizeY / SubHeightC$$

[0195] For $\log_2BlockWidth$ ranging from 0 to 4 and for $\log_2BlockHeight$ ranging from 0 to 4, inclusive, the up-right diagonal and raster scan order array initialization process as specified is invoked with $1 << \log_2BlockWidth$ and $1 << \log_2BlockHeight$ as inputs, and the output is assigned to $DiagScanOrder[\log_2BlockWidth][\log_2BlockHeight]$.

[0196] For $\log_2BlockWidth$ ranging from 0 to 6 and for $\log_2BlockHeight$ ranging from 0 to 6, inclusive, the horizontal and vertical traverse scan order array initialization process as specified is invoked with $1 << \log_2BlockWidth$ and $1 << \log_2BlockHeight$ as inputs, and the output is assigned to $HorTravScanOrder[\log_2BlockWidth][\log_2BlockHeight]$ and $VerTravScanOrder[\log_2BlockWidth][\log_2BlockHeight]$.

[0197] $partition_constraints_override_enabled_flag$ equal to 1 specifies the presence of $partition_constraints_override_flag$ in PHs referring to the SPS. $partition_constraints_override_enabled_flag$ equal to 0 specifies the absence of $partition_constraints_override_flag$ in PHs referring to the SPS.

[0198] $sps_log_2_diff_min_qt_min_cb_intra_slice_luma$ specifies the default difference between the base 2 logarithm of the minimum size in luma samples of a luma leaf block resulting from quadtree splitting of a CTU and the base 2 logarithm of the minimum coding

block size in luma samples for luma CUs in slices with $slice_type$ equal to 2 (I) referring to the SPS. When $partition_constraints_override_enabled_flag$ is equal to 1, the default difference can be overridden by $pic_log_2_diff_min_qt_min_cb_luma$ present in PHs referring to the SPS. The value of $sps_log_2_diff_min_qt_min_cb_intra_slice_luma$ shall be in the range of 0 to $CtbLog_2SizeY - MinCbLog_2SizeY$, inclusive. The base 2 logarithm of the minimum size in luma samples of a luma leaf block resulting from quadtree splitting of a CTU is derived as follows:

$$MinQtLog2SizeIntraY =$$

$$sps_log2_diff_min_qt_min_cb_intra_slice_luma + MinCbLog2SizeY$$

[0199] $sps_log_2_diff_min_qt_min_cb_inter_slice$ specifies the default difference between the base 2 logarithm of the minimum size in luma samples of a luma leaf block resulting from quadtree splitting of a CTU and the base 2 logarithm of the minimum luma coding block size in luma samples for luma CUs in slices with $slice_type$ equal to 0 (B) or 1 (P) referring to the SPS. When $partition_constraints_override_enabled_flag$ is equal to 1, the default difference can be overridden by $pic_log_2_diff_min_qt_min_cb_luma$ present in PHs referring to the SPS. The value of $sps_log_2_diff_min_qt_min_cb_inter_slice$ shall be in the range of 0 to $CtbLog_2SizeY - MinCbLog_2SizeY$, inclusive. The base 2 logarithm of the minimum size in luma samples of a luma leaf block resulting from quadtree splitting of a CTU is derived as follows:

$$MinQtLog2SizeInterY =$$

$$sps_log2_diff_min_qt_min_cb_inter_slice + MinCbLog2SizeY$$

[0200] $sps_max_mtt_hierarchy_depth_inter_slice$ specifies the default maximum hierarchy depth for coding units resulting from multi-type tree splitting of a quadtree leaf in slices with $slice_type$ equal to 0 (B) or 1 (P) referring to the SPS. When $partition_constraints_override_enabled_flag$ is equal to 1, the default maximum hierarchy depth can be overridden by $pic_max_mtt_hierarchy_depth_inter_slice$ present in PHs referring to the SPS. The value of $sps_max_mtt_hierarchy_depth_inter_slice$ shall be in the range of 0 to $2 * (CtbLog_2SizeY - MinCbLog_2SizeY)$, inclusive.

[0201] $sps_max_mtt_hierarchy_depth_intra_slice_luma$ specifies the default maximum hierarchy depth for coding units resulting from multi-type tree splitting of a quadtree leaf in slices with $slice_type$ equal to 2 (I) referring to the SPS. When $partition_constraints_override_enabled_flag$ is equal to 1, the default maximum hierarchy depth can be overridden by $pic_max_mtt_hierarchy_depth_intra_slice_luma$ present in PHs referring to the SPS. The value of $sps_max_mtt_hierarchy_depth_intra_slice_luma$ shall be in the range of 0 to $2 * (CtbLog_2SizeY - MinCbLog_2SizeY)$, inclusive.

[0202] $sps_log_2_diff_max_bt_min_qt_intra_slice_luma$ specifies the default difference between the base

2 logarithm of the maximum size (width or height) in luma samples of a luma coding block that can be split using a binary split and the minimum size (width or height) in luma samples of a luma leaf block resulting from quadtree splitting of a CTU in slices with slice_type equal to 2 (I) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_max_bt_min_qt_luma present in PHs referring to the SPS. The value of sps_log 2_diff_max_bt_min_qt_intra_slice_luma shall be in the range of 0 to CtbLog 2SizeY-MinQtLog 2SizeIntraY, inclusive. When sps_log 2_diff_max_bt_min_qt_intra_slice_luma is not present, the value of sps_log 2_diff_max_bt_min_qt_intra_slice_luma is inferred to be equal to 0.

[0203] sps_log 2_diff_max_tt_min_qt_intra_slice_luma specifies the default difference between the base 2 logarithm of the maximum size (width or height) in luma samples of a luma coding block that can be split using a ternary split and the minimum size (width or height) in luma samples of a luma leaf block resulting from quadtree splitting of a CTU in slices with slice_type equal to 2 (I) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_max_tt_min_qt_luma present in PHs referring to the SPS. The value of sps_log 2_diff_max_tt_min_qt_intra_slice_luma shall be in the range of 0 to CtbLog 2SizeY-MinQtLog 2SizeIntraY, inclusive. When sps_log 2_diff_max_tt_min_qt_intra_slice_luma is not present, the value of sps_log 2_diff_max_tt_min_qt_intra_slice_luma is inferred to be equal to 0.

[0204] sps_log 2_diff_max_bt_min_qt_inter_slice specifies the default difference between the base 2 logarithm of the maximum size (width or height) in luma samples of a luma coding block that can be split using a binary split and the minimum size (width or height) in luma samples of a luma leaf block resulting from quadtree splitting of a CTU in slices with slice_type equal to 0 (B) or 1 (P) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_max_bt_min_qt_luma present in PHs referring to the SPS. The value of sps_log 2_diff_max_bt_min_qt_inter_slice shall be in the range of 0 to CtbLog 2SizeY-MinQtLog 2SizeInterY, inclusive. When sps_log 2_diff_max_bt_min_qt_inter_slice is not present, the value of sps_log 2_diff_max_bt_min_qt_inter_slice is inferred to be equal to 0.

[0205] sps_log 2_diff_max_tt_min_qt_inter_slice specifies the default difference between the base 2 logarithm of the maximum size (width or height) in luma samples of a luma coding block that can be split using a ternary split and the minimum size (width or height) in luma samples of a luma leaf block resulting from quadtree splitting of a CTU in slices with slice_type equal to 0 (B) or 1 (P) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_max_tt_min_qt_luma present in PHs referring to the SPS. The value of sps_log 2_diff_max_tt_min_qt_inter_slice shall be in the range of 0 to CtbLog 2SizeY-MinQtLog 2SizeInterY, inclusive. When sps_log 2_diff_max_tt_min_qt_inter_slice is not present,

the value of sps_log 2_diff_max_tt_min_qt_inter_slice is inferred to be equal to 0.

[0206] sps_log 2_diff_min_qt_min_cb_intra_slice_chroma specifies the default difference between the base 2 logarithm of the minimum size in luma samples of a chroma leaf block resulting from quadtree splitting of a chroma CTU with treeType equal to DUAL_TREE_CHROMA and the base 2 logarithm of the minimum coding block size in luma samples for chroma CUs with treeType equal to DUAL_TREE_CHROMA in slices with slice_type equal to 2 (I) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_min_qt_min_cb_chroma present in PHs referring to the SPS. The value of sps_log 2_diff_min_qt_min_cb_intra_slice_chroma shall be in the range of 0 to CtbLog 2SizeY-MinCbLog 2SizeY, inclusive. When not present, the value of sps_log 2_diff_min_qt_min_cb_intra_slice_chroma is inferred to be equal to 0. The base 2 logarithm of the minimum size in luma samples of a chroma leaf block resulting from quadtree splitting of a CTU with treeType equal to DUAL_TREE_CHROMA is derived as follows:

MinQtLog2SizeIntraC =

sps_log2_diff_min_qt_min_cb_intra_slice_chroma + MinCbLog2SizeY

[0207] sps_max_mtt_hierarchy_depth_intra_slice_chroma specifies the default maximum hierarchy depth for chroma coding units resulting from multi-type tree splitting of a chroma quadtree leaf with treeType equal to DUAL_TREE_CHROMA in slices with slice_type equal to 2 (I) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default maximum hierarchy depth can be overridden by pic_max_mtt_hierarchy_depth_chroma present in PHs referring to the SPS. The value of sps_max_mtt_hierarchy_depth_intra_slice_chroma shall be in the range of 0 to 2*(CtbLog 2SizeY-MinCbLog 2SizeY), inclusive. When not present, the value of sps_max_mtt_hierarchy_depth_intra_slice_chroma is inferred to be equal to 0.

[0208] sps_log 2_diff_max_bt_min_qt_intra_slice_chroma specifies the default difference between the base 2 logarithm of the maximum size (width or height) in luma samples of a chroma coding block that can be split using a binary split and the minimum size (width or height) in luma samples of a chroma leaf block resulting from quadtree splitting of a chroma CTU with treeType equal to DUAL_TREE_CHROMA in slices with slice_type equal to 2 (I) referring to the SPS. When partition_constraints_override_enabled_flag is equal to 1, the default difference can be overridden by pic_log 2_diff_max_bt_min_qt_chroma present in PHs referring to the SPS. The value of sps_log 2_diff_max_bt_min_qt_intra_slice_chroma shall be in the range of 0 to CtbLog 2SizeY-MinQtLog 2SizeIntraC, inclusive. When sps_log 2_diff_max_bt_min_qt_intra_slice_chroma is not present, the value of sps_log 2_diff_max_bt_min_qt_intra_slice_chroma is inferred to be equal to 0.

[0209] `sps_log_2_diff_max_tt_min_qt_intra_slice_chroma` specifies the default difference between the base 2 logarithm of the maximum size (width or height) in luma samples of a chroma coding block that can be split using a ternary split and the minimum size (width or height) in luma samples of a chroma leaf block resulting from quadtree splitting of a chroma CTU with `treeType` equal to `DUAL_TREE_CHROMA` in slices with `slice_type` equal to 2 (I) referring to the SPS. When `partition_constraints_override_enabled_flag` is equal to 1, the default difference can be overridden by `pic_log_2_diff_max_tt_min_qt_chroma` present in PHs referring to the SPS. The value of `sps_log_2_diff_max_tt_min_qt_intra_slice_chroma` shall be in the range of 0 to `CtbLog_2SizeY-MinQtLog_2SizeIntraC`, inclusive. When `sps_log_2_diff_max_tt_min_qt_intra_slice_chroma` is not present, the value of `sps_log_2_diff_max_tt_min_qt_intra_slice_chroma` is inferred to be equal to 0.

[0210] `sps_max_luma_transform_size_64_flag` equal to 1 specifies that the maximum transform size in luma samples is equal to 64. `sps_max_luma_transform_size_64_flag` equal to 0 specifies that the maximum transform size in luma samples is equal to 32.

[0211] When `CtbSizeY` is less than 64, the value of `sps_max_luma_transform_size_64_flag` shall be equal to 0.

[0212] The variables `MinTbLog_2SizeY`, `MaxTbLog_2SizeY`, `MinTbSizeY`, and `MaxTbSizeY` are derived as follows:

$$\text{MinTbLog2SizeY} = 2$$

$$\text{MaxTbLog2SizeY} = \text{sps_max_luma_transform_size_64_flag} ? 6 : 5$$

$$\text{MinTbSizeY} = 1 << \text{MinTbLog2SizeY}$$

$$\text{MaxTbSizeY} = 1 << \text{MaxTbLog2SizeY}$$

[0213] `sps_joint_cbr_enabled_flag` equal to 0 specifies that the joint coding of chroma residuals is disabled. `sps_joint_cbr_enabled_flag` equal to 1 specifies that the joint coding of chroma residuals is enabled.

[0214] `same_qp_table_for_chroma` equal to 1 specifies that only one chroma QP mapping table is signalled and this table applies to Cb and Cr residuals and additionally to joint Cb-Cr residuals when `sps_joint_cbr_enabled_flag` is equal to 1. `same_qp_table_for_chroma` equal to 0 specifies that chroma QP mapping tables, two for Cb and Cr, and one additional for joint Cb-Cr when `sps_joint_cbr_enabled_flag` is equal to 1, are signalled in the SPS. When not present in the same `qp_table_for_chroma` is bitstream, the value of `same_qp_table_for_chroma` is inferred to be equal to 1.

[0215] `qp_table_start_minus26[i]` plus 26 specifies the starting luma and chroma QP used to describe the *i*-th chroma QP mapping table. The value of `qp_table_start_minus26[i]` shall be in the range of $-26 - \text{QpBdOffset}$ to 36 inclusive. When `qp_table_start_minus26[i]` is not present in the bitstream, the value of `qp_table_start_minus26[i]` is inferred to be equal to 0.

[0216] `num_points_in_qp_table_minus1[i]` plus 1 specifies the number of points used to describe the *i*-th chroma QP mapping table. The value of `num_points_in_qp_table_minus1[i]` shall be in the range of 0 to $63 + \text{QpBdOffset}$, inclusive. When `num_points_in_qp_table_minus1[0]` is not present in the bitstream, the value of `num_points_in_qp_table_minus1[0]` is inferred to be equal to 0.

[0217] `delta_qp_in_val_minus1[i][j]` specifies a delta value used to derive the input coordinate of the *j*-th pivot point of the *i*-th chroma QP mapping table. When `delta_qp_in_val_minus1[0][j]` is not present in the bitstream, the value of `delta_qp_in_val_minus1[0][j]` is inferred to be equal to 0.

[0218] `delta_qp_diff_val[i][j]` specifies a delta value used to derive the output coordinate of the *j*-th pivot point of the *i*-th chroma QP mapping table.

[0219] The *i*-th chroma QP mapping table `ChromaQpTable[i]` for $i=0..numQpTables-1$ is derived as follows:

```

qpInVal[ i ][ 0 ] = -qp_table_start_minus26[ i ] + 26
qpOutVal[ i ][ 0 ] = qpInVal[ i ][ 0 ]
for( j = 0; j <= num_points_in_qp_table_minus1[ i ]; j++ ) {
    qpInVal[ i ][ j + 1 ] = qpInVal[ i ][ j ] + delta_qp_in_val_minus1[ i ][ j ] + 1
    qpOutVal[ i ][ j + 1 ] = qpOutVal[ i ][ j ] +
        ( delta_qp_in_val_minus1[ i ][ j ] ^ delta_qp_diff_val[ i ][ j ] )
}
ChromaQpTable[ i ][ qpInVal[ i ][ 0 ] ] = qpOutVal[ i ][ 0 ]
for( k = qpInVal[ i ][ 0 ] - 1; k >= -QpBdOffset; k-- )
    ChromaQpTable[ i ][ k ] = Clip3( -QpBdOffset, 63, ChromaQpTable[ i ][ k + 1 ] - 1 )
for( j = 0; j <+ num_points_in_qp_table_minus1[ i ]; j++ ) {
    sh = ( delta_qp_in_val_minus1[ i ][ j ] + 1 ) >> 1
    for( k = qpInVal[ i ][ j ] + 1, m = 1; k <= qpInVal[ i ][ j + 1 ]; k++, m++ )
        ChromaQpTable[ i ][ k ] = ChromaQpTable[ i ][ qpInVal[ i ][ j ] ] +
            ( ( qpOutVal[ i ][ j + 1 ] - qpOutVal[ i ][ j ] ) * m + sh ) /
            ( delta_qp_in_val_minus1[ i ][ j ] + 1 )
}
for( k = qpInVal[ i ][ num_points_in_qp_table_minus1[ i ] + 1 ] + 1; k <= 63; k++ )
    ChromaQpTable[ i ][ k ] = Clip3( -QpBdOffset, 63, ChromaQpTable[ i ][ k - 1 ] + 1 )
When same_qp_table_for_chroma is equal to 1, ChromaQpTable[ 1 ][ k ] and
ChromaQpTable[ 2 ][ k ] are set equal to ChromaQpTable[ 0 ][ k ] for  $k = -\text{QpBdOffset}..63$ .
It is a requirement of bitstream conformance that the values of qpInVal[ i ][ j ] and
qpOutVal[ i ][ j ] shall be in the range of  $-\text{QpBdOffset}$  to 63, inclusive for  $i = 0..$ 
numQpTables - 1 and  $j = 0..num\_points\_in\_qp\_table\_minus1[ i ] + 1$ .

```

- [0220] `sps_sao_enabled_flag` equal to 1 specifies that the sample adaptive offset process is applied to the reconstructed picture after the deblocking filter process. `sps_sao_enabled_flag` equal to 0 specifies that the sample adaptive offset process is not applied to the reconstructed picture after the deblocking filter process.
- [0221] `sps_alf_enabled_flag` equal to 0 specifies that the adaptive loop filter is disabled. `sps_alf_enabled_flag` equal to 1 specifies that the adaptive loop filter is enabled.
- [0222] `sps_transform_skip_enabled_flag` equal to 1 specifies that `transform_skip_flag` may be present in the transform unit syntax. `sps_transform_skip_enabled_flag` equal to 0 specifies that `transform_skip_flag` is not present in the transform unit syntax.
- [0223] `sps_bdpcm_enabled_flag` equal to 1 specifies that `intra_bdpcm_luma_flag` may be present in the coding unit syntax for intra coding units. `sps_bdpcm_enabled_flag` equal to 0 specifies that `intra_bdpcm_luma_flag` is not present in the coding unit syntax for intra coding units. When not present, the value of `sps_bdpcm_enabled_flag` is inferred to be equal to 0.
- [0224] `sps_bdpcm_chroma_enabled_flag` equal to 1 specifies that `intra_bdpcm_chroma_flag` may be present in the coding unit syntax for intra coding units. `sps_bdpcm_chroma_enabled_flag` equal to 0 specifies that `intra_bdpcm_chroma_flag` is not present in the coding unit syntax for intra coding units. When not present, the value of `sps_bdpcm_chroma_enabled_flag` is inferred to be equal to 0.
- [0225] `sps_ref_wraparound_enabled_flag` equal to 1 specifies that horizontal wrap-around motion compensation is applied in inter prediction. `sps_ref_wraparound_enabled_flag` equal to 0 specifies that horizontal wrap-around motion compensation is not applied. When the value of $(CtbSizeY/MinCbSizeY+1)$ is less than or equal to $(pic_width_in_luma_samples/MinCbSizeY-1)$, where `pic_width_in_luma_samples` is the value of `pic_width_in_luma_samples` in any PPS that refers to the SPS, the value of `sps_ref_wraparound_enabled_flag` shall be equal to 0.
- [0226] `sps_ref_wraparound_offset_minus1` plus 1 specifies the offset used for computing the horizontal wrap-around position in units of `MinCbSizeY` luma samples. The value of `ref_wraparound_offset_minus1` shall be in the range of $(CtbSizeY/MinCbSizeY)+1$ to $(pic_width_in_luma_samples/MinCbSizeY)-1$, inclusive, where `pic_width_in_luma_samples` is the value of `pic_width_in_luma_samples` in any PPS that refers to the SPS.
- [0227] `sps_temporal_mvp_enabled_flag` equal to 1 specifies that temporal motion vector predictors may be used in the CLVS. `sps_temporal_mvp_enabled_flag` equal to 0 specifies that temporal motion vector predictors are not used in the CLVS.
- [0228] `sps_sbtmvp_enabled_flag` equal to 1 specifies that subblock-based temporal motion vector predictors may be used in decoding of pictures with all slices having `slice_type` not equal to 1 in the CLVS. `sps_sbtmvp_enabled_flag` equal to 0 specifies that subblock-based temporal motion vector predictors are not used in the CLVS. When `sps_sbtmvp_enabled_flag` is not present, it is inferred to be equal to 0.
- [0229] `sps_amvr_enabled_flag` equal to 1 specifies that adaptive motion vector difference resolution is used in motion vector coding. `amvr_enabled_flag` equal to 0 specifies that adaptive motion vector difference resolution is not used in motion vector coding.
- [0230] `sps_bdof_enabled_flag` equal to 0 specifies that the bi-directional optical flow inter prediction is disabled. `sps_bdof_enabled_flag` equal to 1 specifies that the bi-directional optical flow inter prediction is enabled.
- [0231] `sps_bdof_pic_present_flag` equal to 1 specifies that `pic_disable_bdof_flag` is present in PHs referring to the SPS. `sps_bdof_pic_present_flag` equal to 0 specifies that `pic_disable_bdof_flag` is not present in PHs referring to the SPS. When `sps_bdof_pic_present_flag` is not present, the value of `sps_bdof_pic_present_flag` is inferred to be equal to 0.
- [0232] `sps_smvd_enabled_flag` equal to 1 specifies that symmetric motion vector difference may be used in motion vector decoding. `sps_smvd_enabled_flag` equal to 0 specifies that symmetric motion vector difference is not used in motion vector coding.
- [0233] `sps_dmvr_enabled_flag` equal to 1 specifies that decoder motion vector refinement based inter bi-prediction is enabled. `sps_dmvr_enabled_flag` equal to 0 specifies that decoder motion vector refinement based inter bi-prediction is disabled.
- [0234] `sps_dmvr_pic_present_flag` equal to 1 specifies that `pic_disable_dmvr_flag` is present in PHs referring to the SPS. `sps_dmvr_pic_present_flag` equal to 0 specifies that `pic_disable_dmvr_flag` is not present in PHs referring to the SPS. When `sps_dmvr_pic_present_flag` is not present, the value of `sps_dmvr_pic_present_flag` is inferred to be equal to 0.
- [0235] `sps_mmvd_enabled_flag` equal to 1 specifies that merge mode with motion vector difference is enabled. `sps_mmvd_enabled_flag` equal to 0 specifies that merge mode with motion vector difference is disabled.
- [0236] `sps_isp_enabled_flag` equal to 1 specifies that intra prediction with subpartitions is enabled. `sps_isp_enabled_flag` equal to 0 specifies that intra prediction with subpartitions is disabled.
- [0237] `sps_mrl_enabled_flag` equal to 1 specifies that intra prediction with multiple reference lines is enabled. `sps_mrl_enabled_flag` equal to 0 specifies that intra prediction with multiple reference lines is disabled.
- [0238] `sps_mip_enabled_flag` equal to 1 specifies that matrix-based intra prediction is enabled. `sps_mip_enabled_flag` equal to 0 specifies that matrix-based intra prediction is disabled.
- [0239] `sps_cclm_enabled_flag` equal to 0 specifies that the cross-component linear model intra prediction from luma component to chroma component is disabled. `sps_cclm_enabled_flag` equal to 1 specifies that the cross-component linear model intra prediction from luma component to chroma component is enabled. When `sps_cclm_enabled_flag` is not present, it is inferred to be equal to 0.
- [0240] `sps_chroma_horizontal_collocated_flag` equal to 1 specifies that prediction processes operate in a manner designed for chroma sample positions that are not horizontally shifted relative to corresponding luma sample positions. `sps_chroma_horizontal_collocated_flag`

flag equal to 0 specifies that prediction processes operate in a manner designed for chroma sample positions that are shifted to the right by 0.5 in units of luma samples relative to corresponding luma sample positions. When `sps_chroma_horizontal_collocated_flag` is not present, it is inferred to be equal to 1.

[0241] `sps_chroma_vertical_collocated_flag` equal to 1 specifies that prediction processes operate in a manner designed for chroma sample positions that are not vertically shifted relative to corresponding luma sample positions. `sps_chroma_vertical_collocated_flag` equal to 0 specifies that prediction processes operate in a manner designed for chroma sample positions that are shifted downward by 0.5 in units of luma samples relative to corresponding luma sample positions. When `sps_chroma_vertical_collocated_flag` is not present, it is inferred to be equal to 1.

[0242] `sps_mts_enabled_flag` equal to 1 specifies that `sps_explicit_mts_intra_enabled_flag` is present in the sequence parameter set RBSP syntax and that `sps_explicit_mts_inter_enabled_flag` is present in the sequence parameter set RBSP syntax. `sps_mts_enabled_flag` equal to 0 specifies that `sps_explicit_mts_intra_enabled_flag` is not present in the sequence parameter set RBSP syntax and that `sps_explicit_mts_inter_enabled_flag` is not present in the sequence parameter set RBSP syntax.

[0243] `sps_explicit_mts_intra_enabled_flag` equal to 1 specifies that `mts_idx` may be present in intra coding unit syntax, `sps_explicit_mts_intra_enabled_flag` equal to 0 specifies that `mts_idx` is not present in intra coding unit syntax. When not present, the value of `sps_explicit_mts_intra_enabled_flag` is inferred to be equal to 0.

[0244] `sps_explicit_mts_inter_enabled_flag` equal to 1 specifies that `mts_idx` may be present in inter coding unit syntax. `sps_explicit_mts_inter_enabled_flag` equal to 0 specifies that `mts_idx` is not present in inter coding unit syntax. When not present, the value of `sps_explicit_mts_inter_enabled_flag` is inferred to be equal to 0.

[0245] `sps_sbt_enabled_flag` equal to 0 specifies that subblock transform for inter-predicted CUs is disabled. `sps_sbt_enabled_flag` equal to 1 specifies that subblock transform for inter-predicted CU is enabled.

[0246] `sps_affine_enabled_flag` specifies whether affine model based motion compensation can be used for inter prediction. If `sps_affine_enabled_flag` is equal to 0, the syntax shall be constrained such that no affine model based motion compensation is used in the CLVS, and `inter_affine_flag` and `cu_affine_type_flag` are not present in coding unit syntax of the CLVS. Otherwise (`sps_affine_enabled_flag` is equal to 1), affine model based motion compensation can be used in the CLVS.

[0247] `sps_affine_type_flag` specifies whether 6-parameter affine model based motion compensation can be used for inter prediction. If `sps_affine_type_flag` is equal to 0, the syntax shall be constrained such that no 6-parameter affine model based motion compensation is used in the CLVS, and `cu_affine_type_flag` is not present in coding unit syntax in the CLVS. Otherwise (`sps_affine_type_flag` is equal to 1), 6-parameter affine model based motion compensation can be used in the CLVS. When not present, the value of `sps_affine_type_flag` is inferred to be equal to 0.

[0248] `sps_affine_amvr_enabled_flag` equal to 1 specifies that adaptive motion vector difference resolution is used in motion vector coding of affine inter mode. `sps_affine_amvr_enabled_flag` equal to 0 specifies that adaptive motion vector difference resolution is not used in motion vector coding of affine inter mode. When not present, the value of `sps_affine_amvr_enabled_flag` is inferred to be equal to 0.

[0249] `sps_affine_prof_enabled_flag` specifies whether the prediction refinement with optical flow can be used for affine motion compensation. If `sps_affine_prof_enabled_flag` is equal to 0, the affine motion compensation shall not be refined with optical flow. Otherwise (`sps_affine_prof_enabled_flag` is equal to 1), the affine motion compensation can be refined with optical flow. When not present, the value of `sps_affine_prof_enabled_flag` is inferred to be equal to 0.

[0250] `sps_prof_pic_present_flag` equal to 1 specifies that `pic_disable_prof_flag` is present in PHs referring to the SPS. `sps_prof_pic_present_flag` equal to 0 specifies that `pic_disable_prof_flag` is not present in PHs referring to the SPS. When `sps_prof_pic_present_flag` is not present, the value of `sps_prof_pic_present_flag` is inferred to be equal to 0.

[0251] `sps_palette_enabled_flag` equal to 1 specifies that `pred_mode_plt_flag` may be present in the coding unit syntax. `sps_palette_enabled_flag` equal to 0 specifies that `pred_mode_plt_flag` is not present in the coding unit syntax. When `sps_palette_enabled_flag` is not present, it is inferred to be equal to 0.

[0252] `sps_act_enabled_flag` equal to 1 specifies that adaptive colour transform may be used and the `cu_act_enabled_flag` may be present in the coding unit syntax. `sps_act_enabled_flag` equal to 0 specifies that adaptive colour transform is not used and `cu_act_enabled_flag` is not present in the coding unit syntax. When `sps_act_enabled_flag` is not present, it is inferred to be equal to 0.

[0253] `sps_bcw_enabled_flag` specifies whether bi-prediction with CU weights can be used for inter prediction. If `sps_bcw_enabled_flag` is equal to 0, the syntax shall be constrained such that no bi-prediction with CU weights is used in the CLVS, and `bew_idx` is not present in coding unit syntax of the CLVS. Otherwise (`sps_bcw_enabled_flag` is equal to 1), bi-prediction with CU weights can be used in the CLVS.

[0254] `sps_ibc_enabled_flag` equal to 1 specifies that the IBC prediction mode may be used in decoding of pictures in the CLVS. `sps_ibc_enabled_flag` equal to 0 specifies that the IBC prediction mode is not used in the CLVS. When `sps_ibc_enabled_flag` is not present, it is inferred to be equal to 0.

[0255] `sps_ciip_enabled_flag` specifies that `ciip_flag` may be present in the coding unit syntax for inter coding units. `sps_ciip_enabled_flag` equal to 0 specifies that `ciip_flag` is not present in the coding unit syntax for inter coding units.

[0256] `sps_fpel_mmvd_enabled_flag` equal to 1 specifies that merge mode with motion vector difference is using integer sample precision. `sps_fpel_mmvd_enabled_flag` equal to 0 specifies that merge mode with motion vector difference can use fractional sample precision.

- [0257] `sps_triangle_enabled_flag` specifies whether triangular shape based motion compensation can be used for inter prediction. `sps_triangle_enabled_flag` equal to 0 specifies that the syntax shall be constrained such that no triangular shape based motion compensation is used in the CLVS, and `merge_triangle_split_dir`, `merge_triangle_idx0`, and `merge_triangle_idx1` are not present in coding unit syntax of the CLVS. `sps_triangle_enabled_flag` equal to 1 specifies that triangular shape based motion compensation can be used in the CLVS.
- [0258] `sps_lmcs_enabled_flag` equal to 1 specifies that luma mapping with chroma scaling is used in the CLVS. `sps_lmcs_enabled_flag` equal to 0 specifies that luma mapping with chroma scaling is not used in the CLVS.
- [0259] `sps_lfnst_enabled_flag` equal to 1 specifies that `lfnst_idx` may be present in intra coding unit syntax. `sps_lfnst_enabled_flag` equal to 0 specifies that `lfnst_idx` is not present in intra coding unit syntax.
- [0260] `sps_ladf_enabled_flag` equal to 1, specifies that `sps_num_ladf_intervals_minus2`, `sps_ladf_qp_offset[i]`, and `sps_ladf_lowest_interval_qp_offset`, `sps_ladf_delta_threshold_minus1[i]` are present in the SPS.
- [0261] `sps_num_ladf_intervals_minus2` plus 1 specifies the number of `sps_ladf_delta_threshold_minus1[i]` and `sps_ladf_qp_offset[i]` syntax elements that are present in the SPS. The value of `sps_num_ladf_intervals_minus2` shall be in the range of 0 to 3, inclusive.
- [0262] `sps_ladf_lowest_interval_qp_offset` specifies the offset used to derive the variable `qP` as specified. The value of `sps_ladf_lowest_interval_qp_offset` shall be in the range of -63 to 63, inclusive.
- [0263] `sps_ladf_qp_offset[i]` specifies the offset array used to derive the variable `qP` as specified. The value of `sps_ladf_qp_offset[i]` shall be in the range of -63 to 63, inclusive.
- [0264] `sps_ladf_delta_threshold_minus1[i]` is used to compute the values of `SpsLadfIntervalLowerBound[i]`, which specifies the lower bound of the *i*-th luma intensity level interval. The value of `sps_ladf_delta_threshold_minus1[i]` shall be in the range of 0 to $2^{BitDepth}-3$, inclusive.
- [0265] The value of `SpsLadfIntervalLowerBound[0]` is set equal to 0.
- [0266] For each value of *i* in the range of 0 to `sps_num_ladf_intervals_minus2`, inclusive, the variable `SpsLadfIntervalLowerBound[i+1]` is derived as follows:

$$SpsLadfIntervalLowerBound[i+1] =$$

$$SpsLadfIntervalLowerBound[i] + sps_ladf_delta_threshold_minus1[i] + 1$$

- [0267] `sps_scaling_list_enabled_flag` equal to 1 specifies that a scaling list is used for the scaling process for transform coefficients, `sps_scaling_list_enabled_flag` equal to 0 specifies that scaling list is not used for the scaling process for transform coefficients.
- [0268] `sps_loop_filter_across_virtual_boundaries_disabled_present_flag` equal to 1 specifies that the in-loop filtering operations are disabled across the virtual boundaries in pictures referring to the SPS. `sps_loop_filter_across_virtual_boundaries_disabled_present`

flag equal to 0 specifies that no such disabling of in-loop filtering operations is applied in pictures referring to the SPS. In-loop filtering operations include the deblocking filter, sample adaptive offset filter, and adaptive loop filter operations.

- [0269] `sps_num_ver_virtual_boundaries` specifies the number of `sps_virtual_boundaries_pos_x[i]` syntax elements that are present in the SPS. When `sps_num_ver_virtual_boundaries` is not present, it is inferred to be equal to 0.
- [0270] `sps_virtual_boundaries_pos_x[i]` is used to compute the value of `VirtualBoundariesPosX[i]`, which specifies the location of the *i*-th vertical virtual boundary in units of luma samples. The value of `sps_virtual_boundaries_pos_x[i]` shall be in the range of 0 to $\text{Ceil}(\text{pic_width_in_luma_samples}+8)-1$, inclusive.
- [0271] `sps_num_hor_virtual_boundaries` specifies the number of `sps_virtual_boundaries_pos_y[i]` syntax elements that are present in the SPS. When `sps_num_hor_virtual_boundaries` is not present, it is inferred to be equal to 0.
- [0272] `sps_virtual_boundaries_pos_y[i]` is used to compute the value of `VirtualBoundariesPosY[i]`, which specifies the location of the *i*-th horizontal virtual boundary in units of luma samples. The value of `sps_virtual_boundaries_pos_y[i]` shall be in the range of 0 to $\text{Ceil}(\text{pic_height_in_luma_samples}+8)-1$, inclusive.
- [0273] `sps_general_hrd_params_present_flag` equal to 1 specifies that the syntax structure `general_hrd_parameters()` is present in the SPS RBSP syntax structure. `sps_general_hrd_params_present_flag` equal to 0 specifies that the syntax structure `general_hrd_parameters()` is not present in the SPS RBSP syntax structure.
- [0274] `sps_sublayer_cpb_params_present_flag` equal to 1 specifies that the syntax structure `old_hrd_parameters()` in the SPS RBSP includes HRD parameters for sublayer representations with `TemporalId` in the range of 0 to `sps_max_sublayers_minus1`, inclusive. `sps_sublayer_cpb_params_present_flag` equal to 0 specifies that the syntax structure `ols_hrd_parameters()` in the SPS RBSP includes HRD parameters for the sublayer representation with `TemporalId` equal to `sps_max_sublayers_minus1` only. When `sps_max_sublayers_minus1` is equal to 0, the value of `sps_sublayer_cpb_params_present_flag` is inferred to be equal to 0.
- [0275] When `sps_sublayer_cpb_params_present_flag` is equal to 0, the HRD parameters for the sublayer representations with `TemporalId` in the range of 0 to `sps_max_sublayers_minus1-1`, inclusive, are inferred to be the same as that for the sublayer representation with `TemporalId` equal to `sps_max_sublayers_minus1`. These include the HRD parameters starting from the fixed `pic_rate_general_flag[i]` syntax element till the `sublayer_hrd_parameters(i)` syntax structure immediately under the condition “if (`general_vcl_hrd_params_present_flag`)” in the `ols_hrd_parameters` syntax structure.
- [0276] `field_seq_flag` equal to 1 indicates that the CLVS conveys pictures that represent fields. `field_seq_flag` equal to 0 indicates that the CLVS conveys pictures that represent frames. When `general_frame_only_constraint_flag` is equal to 1, the value of `field_seq_flag` shall be equal to 0. When `field_seq_flag` is equal to 1,

a frame-field information SEI message shall be present for every coded picture in the CLVS.

[0277] NOTE—The specified decoding process does not treat pictures that represent fields or frames differently. A sequence of pictures that represent fields would therefore be coded with the picture dimensions of an individual field. For example, pictures that represent 1080i fields would commonly have cropped output dimensions of 1920×540, while the sequence picture rate would commonly express the rate of the source fields (typically between 50 and 60 Hz), instead of the source frame rate (typically between 25 and 30 Hz).

[0278] `vui_parameters_present_flag` equal to 1 specifies that the syntax structure `vui_parameters()` is present in the SPS RBSP syntax structure. `vui_parameters_present_flag` equal to 0 specifies that the syntax structure `vui_parameters()` is not present in the SPS RBSP syntax structure.

[0279] `sps_extension_flag` equal to 0 specifies that no `sps_extension_data_flag` syntax elements are present in the SPS RBSP syntax structure. `sps_extension_flag` equal to 1 specifies that there are `sps_extension_data_flag` syntax elements present in the SPS RBSP syntax structure.

[0280] `sps_extension_data_flag` may have any value. Its presence and value do not affect decoder conformance to profiles specified in this version of this Specification. Decoders conforming to this version of this Specification shall ignore all `sps_extension_data_flag` syntax elements.

[0281] As described above, in JVET-P2001 when `sps_general_hrd_params_present_flag` is equal to 1 the syntax structure `general_hrd_parameters()` is present in the SPS RBSP syntax structure. Table 4 illustrates the `general_hrd_parameters()` syntax structure provided in JVET-P2001.

TABLE 4

	Descriptor

<code>hrd_cpb_cnt_minus1</code>	ue(v)
}	

[0282] With respect to Table 4, JVET-P2001 provides the following semantics:

[0283] The `general_hrd_parameters()` syntax structure provides HRD parameters used in the HRD operations. It is a requirement of bitstream conformance that the content of the `general_hrd_parameters()` syntax structure present in any VPSs or SPSs in the bitstream shall be identical.

[0284] When included in a VPS, the `general_hrd_parameters()` syntax structure applies to all OLSs specified

by the VPS. When included in an SPS, the `general_hrd_parameters()` syntax structure applies to the OLS that includes only the layer that is the lowest layer among the layers that refer to the SPS, and this lowest layer is an independent layer.

[0285] `num_units_in_tick` is the number of time units of a clock operating at the frequency time scale Hz that corresponds to one increment (called a clock tick) of a clock tick counter. `num_units_in_tick` shall be greater than 0. A clock tick, in units of seconds, is equal to the quotient of `num_units_in_tick` divided by time scale. For example, when the picture rate of a video signal is 25 Hz, time scale may be equal to 27 000 000 and `num_units_in_tick` may be equal to 1 080 000, and consequently a clock tick may be equal to 0.04 seconds.

[0286] `time_scale` is the number of time units that pass in one second. For example, a time coordinate system that measures time using a 27 MHz clock has a time scale of 27 000 000. The value of `time_scale` shall be greater than 0.

[0287] `general_nal_hrd_params_present_flag` equal to 1 specifies that NAL HRD parameters (pertaining to Type II bitstream conformance point) are present in the `general_hrd_parameters()` syntax structure. `general_nal_hrd_params_present_flag` equal to 0 specifies that NAL HRD parameters are not present in the `general_hrd_parameters()` syntax structure.

[0288] NOTE—When `general_nal_hrd_params_present_flag` is equal to 0, the conformance of the bitstream cannot be verified without provision of the NAL HRD parameters and all BP SEI messages, and, when `general_vcl_hrd_params_present_flag` is also equal to 0, all PT and DU information SEI messages, by some means not specified in this Specification.

[0289] The variable `NalHrdBpPresentFlag` is derived as follows:

[0290] If one or more of the following conditions are true, the value of `NalHrdBpPresentFlag` is set equal to 1:

[0291] `general_nal_hrd_params_present_flag` is present in the bitstream and is equal to 1.

[0292] The need for presence of BPs for NAL HRD operation to be present in the bitstream in

[0293] BP SEI messages is determined by the application, by some means not specified in this Specification.

[0294] Otherwise, the value of `NalHrdBpPresentFlag` is set equal to 0.

[0295] `general_vcl_hrd_params_present_flag` equal to 1 specifies that VCL HRD parameters (pertaining to Type I bitstream conformance point) are present in the `general_hrd_parameters()` syntax structure. `general_vcl_hrd_params_present_flag` equal to 0 specifies that VCL HRD parameters are not present in the `general_hrd_parameters()` syntax structure.

[0296] NOTE—When `general_vcl_hrd_params_present_flag` is equal to 0, the conformance of the bitstream cannot be verified without provision of the VCL HRD parameters and all BP SEI messages, and when `general_nal_hrd_params_present_flag` is also equal to 0, all PT and DU information SEI messages, by some means not specified in this Specification.

[0297] The variable `VclHrdBpPresentFlag` is derived as follows:

[0298] If one or more of the following conditions are true, the value of `VclHrdBpPresentFlag` is set equal to 1:

[0299] `general_vel_hrd_params_present_flag` is present in the bitstream and is equal to 1.

[0300] The need for presence of BPs for VCL HRD operation to be present in the bitstream in

[0301] BP SEI messages is determined by the application, by some means not specified in this Specification.

[0302] Otherwise, the value of `VclHrdBpPresentFlag` is set equal to 0.

[0303] The variable `CpbDpbDelaysPresentFlag` is derived as follows:

[0304] If one or more of the following conditions are true, the value of `CpbDpbDelaysPresentFlag` is set equal to 1:

[0305] `general_nal_hrd_params_present_flag` is present in the bitstream and is equal to 1.

[0306] `general_vcl_hrd_params_present_flag` is present in the bitstream and is equal to 1.

[0307] The need for presence of CPB and DPB output delays to be present in the bitstream in

[0308] PT SEI messages is determined by the application, by some means not specified in this Specification.

[0309] Otherwise, the value of `CpbDpbDelaysPresentFlag` is set equal to 0.

[0310] It is a requirement of bitstream conformance that the values of `general_nal_hrd_params_present_flag` and `general_vel_hrd_params_present_flag` in each `general_hrd_parameters()` syntax structure shall not be both equal to 0.

[0311] `general_decoding_unit_hrd_params_present_flag` equal to 1 specifies that DU level HRD parameters are present and the HRD may operate at AU level or DU level. `general_decoding_unit_hrd_params_present_flag` equal to 0 specifies that DU level HRD parameters are not present and the HRD operates at AU level. When `general_decoding_unit_hrd_params_present_flag` is not present, its value is inferred to be equal to 0.

[0312] `tick_divisor_minus2` is used to specify the clock sub-tick. A clock sub-tick is the minimum interval of time that can be represented in the coded data when `general_decoding_unit_hrd_params_present_flag` is equal to 1.

[0313] `bit_rate_scale` (together with `bit_rate_value_minus1[i][j]`) specifies the maximum input bit rate of the j-th CPB when `Htid` is equal to i.

[0314] `cpb_size_scale` (together with `cpb_size_value_minus1[i][j]`) specifies the CPB size of the j-th CPB when `Htid` is equal to i and when the CPB operates at the AU level.

[0315] `cpb_size_du_scale` (together with `cpb_size_du_value_minus1[i][j]`) specifies the CPB size of the j-th CPB when `Htid` is equal to i and when the CPB operates at DU level.

[0316] `hrd_cpb_cnt_minus1` plus 1 specifies the number of alternative CPB delivery schedules. The value of `hrd_cpb_cnt_minus1` shall be in the range of 0 to 31, inclusive.

[0317] As described above, in JVET-P2001 when `sps_sublayer_cpb_params_present_flag` equal to 1 the syntax structure `old_hrd_parameters()` is present in the

SPS RBSP syntax structure. Table 5 illustrates the `ols_hrd_parameters()` syntax structure provided in JVET-P2001.

TABLE 5

	Descriptor
<code>ols_hrd_parameters(firstSubLayer, maxSubLayers) {</code>	
<code>for(i = firstSubLayer; i <= maxSubLayers; i++) {</code>	
<code>fixed_pic_rate_general_flag[i]</code>	u(1)
<code>if(!fixed_pic_rate_general_flag[i])</code>	
<code>fixed_pic_rate_within_cvs_flag[i]</code>	u(1)
<code>if(fixed_pic_rate_within_cvs_flag[i])</code>	
<code>elemental_duration_in_tc_minus1[i]</code>	ue(v)
<code>else if(hrd_cpb_cnt_minus1 == 0)</code>	
<code>low_delay_hrd_flag[i]</code>	u(1)
<code>if(general_nal_hrd_params_present_flag)</code>	
<code>sublayer_hrd_parameters(i)</code>

<code>sublayer_hrd_parameters(i)</code>	
<code>}</code>	
<code>}</code>	

[0318] With respect to Table 5, JVET-P2001 provides the following semantics:

[0319] When an `ols_hrd_parameters()` syntax structure is included in a VPS, the OLSs to which the `ols_hrd_parameters()` syntax structure applies are specified by the VPS. When an `ols_hrd_parameters()` syntax structure is included in an SPS, the `ols_hrd_parameters()` syntax structure applies to the OLS that includes only the layer that is the lowest layer among the layers that refer to the SPS, and this lowest layer is an independent layer.

[0320] `fixed_pic_rate_general_flag[i]` equal to 1 indicates that, when `Htid` is equal to i, the temporal distance between the HRD output times of consecutive pictures in output order is constrained as specified below. `fixed_pic_rate_general_flag[i]` equal to 0 indicates that this constraint may not apply.

[0321] When `fixed_pic_rate_general_flag[i]` is not present, it is inferred to be equal to 0. `fixed_pic_rate_within_cvs_flag[i]` equal to 1 indicates that, when `Htid` is equal to i, the temporal distance between the HRD output times of consecutive pictures in output order is constrained as specified below. `fixed_pic_rate_within_cvs_flag[i]` equal to 0 indicates that this constraint may not apply.

[0322] When `fixed_pic_rate_general_flag[i]` is equal to 1, the value of `fixed_pic_rate_within_cvs_flag[i]` is inferred to be equal to 1.

[0323] `elemental_duration_in_tc_minus1[i]` plus 1 (when present) specifies, when `Htid` is equal to i, the temporal distance, in clock ticks, between the elemental units that specify the HRD output times of consecutive pictures in output order as specified below. The value of `elemental_duration_in_tc_minus1[i]` shall be in the range of 0 to 2047, inclusive.

[0324] When `Htid` is equal to i and `fixed_pic_rate_general_flag[i]` is equal to 1 for a CVS containing picture n, and picture n is a picture that is output and is not the last picture in the bitstream (in output order) that is output, the value of the variable `DpbOutputElementalInterval[n]` is specified by:

$$DpbOutputElementalInterval[n] = DpbOutputInterval[n] + ElementalOutputPeriods$$

[0325] where DpbOutputInterval[n] is specified below and ElementalOutputPeriods is specified as follows:

[0326] If a frame-field information SEI message is present for picture n that contains a display_elemental_periods_minus1 syntax element, ElementalOutputPeriods is equal to the value of display_elemental_periods_minus1+1.

[0327] Otherwise, ElementalOutputPeriods is equal to 1.

[0328] When Htid is equal to i and fixed_pic_rate_general_flag[i] is equal to 1 for a CVS containing picture n, and picture n is a picture that is output and is not the last picture in the bitstream (in output order) that is output, the value computed for DpbOutputElementalInterval [n] shall be equal to ClockTick*(elemental_duration_in_tc_minus1[i]+1), wherein ClockTick is as specified as ClockTick=num_units_in_tick+time_scale (using the value of ClockTick for the CVS containing picture n) when one of the following conditions is true for the following picture in output order nextPicInOutputOrder that is specified as provided below:

[0329] picture nextPicInOutputOrder is in the same CVS as picture n.

[0330] picture nextPicInOutputOrder is in a different CVS and fixed_pic_rate_general_flag[i] is equal to 1 in the CVS containing picture nextPicInOutputOrder, the value of ClockTick is the same for both CVSs, and the value of elemental_duration_in_tc_minus1[i] is the same for both CVSs.

[0331] When picture n is a picture that is output and is not the last picture of the bitstream that is output, the value of the variable DpbOutputInterval[n] is derived as follows:

[0332] DpbOutputInterval[n]=DpbOutputTime[nextPicInOutputOrder]–DpbOutputTime[n]

[0333] where nextPicInOutputOrder is the picture that follows picture n in output order and has PictureOutputFlag equal to 1.

[0334] When Htid is equal to i and fixed_pic_rate_within_cvs_flag[i] is equal to 1 for a CVS containing picture n, and picture n is a picture that is output and is not the last picture in the CVS (in output order) that is output, the value computed for DpbOutputElementalInterval [n] shall be equal to ClockTick*(elemental_duration_in_tc_minus1[i]+1), wherein ClockTick is as specified provided above (using the value of ClockTick for the CVS containing picture n) when the following picture in output order nextPicInOutputOrder that is specified for use in the equation specified above is in the same CVS as picture n.

[0335] low_delay_hrd_flag[i] specifies the HRD operational mode, when Htid is equal to i, as specified. When not present, the value of low_delay_hrd_flag[i] is inferred to be equal to 0.

[0336] NOTE—When low_delay_hrd_flag[i] is equal to 1, “big pictures” that violate the nominal CPB removal times due to the number of bits used by

an AU are permitted. It is expected, but not required, that such “big pictures” occur only occasionally.

[0337] As described above, in JVET-P2001 when sublayer_hrd_parameters() may be present in the ols_hrd_parameters() syntax structure. Table 6 illustrates the sub_layer_hrd_parameters() syntax structure provided in JVET-P2001.

TABLE 6

	De- scriptor
sublayer_hrd_parameters(subLayerId) {	
for(j = 0; j <= hrd_cpb_cnt_minus1; j++) {	
bit_rate_value_minus1[subLayerId][j]	ue(v)
cpb_size_value_minus1[subLayerId][j]	ue(v)
if(general_decoding_unit_hrd_params_present_flag) {	
cpb_size_du_value_minus1[subLayerId][j]	ue(v)
bit_rate_du_value_minus1[subLayerId][j]	ue(v)
}	
cbr_flag[subLayerId][j]	u(1)
}	
}	

[0338] With respect to Table 6, JVET-P2001 provides the following semantics:

[0339] bit_rate_value_minus1[i][j] (together with bit_rate_scale) specifies the maximum input bit rate for the j-th CPB with Htid equal to i when the CPB operates at the AU level. bit_rate_value_minus1[i][j] shall be in the range of 0 to 282-2, inclusive. For any j greater than 0 and any particular value of i, bit_rate_value_minus1[i][j] shall be greater than bit_rate_value_minus1[i][j-1].

[0340] When DecodingUnitHrdFlag is equal to 0, the following applies:

[0341] The bit rate in bits per second is given by:

$$\text{BitRate}[i][j] = (\text{bit_rate_value_minus1}[i][j] + 1) * 2^{(6 + \text{bit_rate_scale})}$$

[0342] When the bit_rate_value_minus1[i][j] syntax element is not present, it is inferred as follows:

[0343] If general_hrd_params_present_flag is equal to 1, bit_rate_value_minus1[i][j] is inferred to be equal to bit_rate_value_minus1[sps_max_sublayers_minus1][j].

[0344] Otherwise (general_hrd_params_present_flag is equal to 0), the value of BitRate[i][j] is inferred to be equal to CpbBrVclFactor*MaxBR for VCL HRD parameters and to be equal to CpbBrNalFactor*MaxBR for NAL HRD parameters, where MaxBR, CpbBrVclFactor and CpbBrNalFactor are specified for example as provided in Tables 7A-7C.

Main 4:4:4 10	2 500	2 750	3.750	0.5

[0345] $\text{cpb_size_value_minus1}[i][j]$ is used together with cpb_size_scale to specify the j -th CPB size with Htid equal to i when the CPB operates at the AU level. $\text{cpb_size_value_minus1}[i][j]$ shall be in the range of 0 to $2^{32}-2$, inclusive. For any j greater than 0 and any particular value of i , $\text{cpb_size_value_minus1}[i][j]$ shall less than or equal be to $\text{cpb_size_value_minus1}[i][j-1]$.

[0346] When $\text{DecodingUnitHrdFlag}$ is equal to 0, the following applies:

[0347] The CPB size in bits is given by:

$$\text{CpbSize}[i][j] = (\text{cpb_size_value_minus1}[i][j] + 1) * 2^{(4 + \text{cpb_size_scale})}$$

[0348] When the $\text{cpb_size_value_minus1}[i][j]$ syntax element is not present, it is inferred as follows:

[0349] If $\text{general_hrd_params_present_flag}$ is equal to 1, $\text{cpb_size_value_minus1}[i][j]$ is inferred to be equal to $\text{cpb_size_value_minus1}[\text{sps_max_sublayers_minus1}][j]$.

[0350] Otherwise ($\text{general_hrd_params_present_flag}$ is equal to 0), the value of $\text{CpbSize}[i][j]$ is inferred to be equal to $\text{CpbBrVclFactor} * \text{MaxCPB}$ for VCL HRD parameters and to be equal to $\text{CpbBrNalFactor} * \text{MaxCPB}$ for NAL HRD parameters, where MaxCPB , CpbBrVclFactor and CpbBrNalFactor are specified above.

[0351] $\text{cpb_size_du_value_minus1}[i][j]$ is used together with cpb_size_du_scale to specify the i -th CPB size with Htid equal when the CPB operates at DU level.

[0352] $\text{cpb_size_du_value_minus1}[i][j]$ shall be in the range of 0 to $2^{32}-2$, inclusive. For any j greater than 0

and any particular value of i , $\text{cpb_size_du_value_minus1}[i][j]$ shall be less than or equal to $\text{cpb_size_du_value_minus1}[i][j-1]$.

[0353] When $\text{DecodingUnitHrdFlag}$ is equal to 1, the following applies:

[0354] The CPB size in bits is given by:

$$\text{CpbSize}[i][j] = (\text{cpb_size_du_value_minus1}[i][j] + 1) * 2^{(4 + \text{cpb_size_du_scale})}$$

[0355] When the $\text{cpb_size_du_value_minus1}[i][j]$ syntax element is not present, it is inferred as follows:

[0356] If $\text{general_hrd_params_present_flag}$ is equal to 1, $\text{cpb_size_du_value_minus1}[i][j]$ is

inferred to be equal to $\text{cpb_size_du_value_minus1}[\text{sps_max_sublayers_minus1}][j]$.

[0357] Otherwise ($\text{general_hrd_params_present_flag}$ is equal to 0), the value of $\text{CpbSize}[i][j]$ is inferred to be equal to $\text{CpbVclFactor} * \text{MaxCPB}$ for VCL HRD parameters and to be equal to $\text{CpbNalFactor} * \text{MaxCPB}$ for NAL HRD parameters, where MaxCPB , CpbVclFactor and CpbNalFactor are specified above.

[0358] $\text{bit_rate_du_value_minus1}[i][j]$ (together with bit_rate_scale) specifies the maximum input bit rate for the j -th CPB with Htid equal to i when the CPB operates at the DU level. $\text{bit_rate_du_value_minus1}[i][j]$ shall be in the range of 0 to $2^{32}-2$, inclusive. For any j greater than 0 and any particular value of i , $\text{bit_rate_du_value_minus1}[i][j]$ shall be greater than $\text{bit_rate_du_value_minus1}[i][j-1]$.

[0359] When $\text{DecodingUnitHrdFlag}$ is equal to 1, the following applies:

[0360] The bit rate in bits per second is given by:

$$\text{BitRate}[i][j] = (\text{bit_rate_du_value_minus1}[i][j] + 1) * 2^{(6 + \text{bit_rate_scale})}$$

[0361] When the $\text{bit_rate_du_value_minus1}[i][j]$ syntax element is not present, it is inferred as follows:

[0362] If $\text{general_hrd_params_present_flag}$ is equal to 1, $\text{bit_rate_du_value_minus1}[i][j]$ is

inferred to be $\text{bit_rate_du_value_minus1}[\text{sps_max_sublayers_minus1}][j]$.

[0363] Otherwise ($\text{general_hrd_params_present_flag}$ is equal to 0), the value of $\text{BitRate}[i][j]$ is inferred to be equal to $\text{BrVclFactor} * \text{MaxBR}$ for VCL HRD parameters and to be equal to $\text{BrNalFactor} * \text{MaxBR}$ for NAL HRD parameters, where MaxBR , BrVclFactor and BrNalFactor are specified above.

[0364] $\text{cbr_flag}[i][j]$ equal to 0 specifies that to decode this bitstream by the HRD using the j -th CPB specification, the hypothetical stream scheduler (HSS) operates in an intermittent bit rate mode. $\text{cbr_flag}[i][j]$ equal to 1 specifies that the HSS operates in a constant bit rate (CBR) mode.

[0365] When not present, the value of $\text{cbr_flag}[i][j]$ is inferred as follows:

[0366] When the $\text{cbr_flag}[i][j]$ syntax element is not present, it is inferred as follows:

[0367] If $\text{general_hrd_params_present_flag}$ is equal to 1, $\text{cbr_flag}[i][j]$ is inferred to be equal to $\text{cbr_flag}[\text{sps_max_sublayers_minus1}][j]$.

[0368] Otherwise ($\text{general_hrd_params_present_flag}$ is equal to 0), the value of $\text{cbr_flag}[i][j]$ is inferred to be equal to 0.

[0369] As described above, JVET-P2001 enables SEI messages to be signaled which assist in processes related to decoding, display or other purposes. Further, a type of SEI message for VCL HRD operations includes buffering period SEI messages. Table 8 illustrates the buffering period() syntax structure provided in JVET-P2001.

[0370] With respect to Table 8, JVET-P2001 provides the following semantics:

[0371] A BP SEI message provides initial CPB removal delay and initial CPB removal delay offset information for initialization of the HRD at the position of the associated AU in decoding order. When the BP SEI message is present, a picture is said to be a notDiscardablePic picture when the picture has TemporalId equal to 0 and is not a RASL or RADL picture.

[0372] When the current picture is not the first picture in the bitstream in decoding order, let prevNonDiscardablePic be the preceding picture in decoding order with TemporalId equal to 0 that is not a RASL or RADL picture.

[0373] The presence of BP SEI messages is specified as follows:

[0374] If NalHrdBpPresentFlag is equal to 1 or VclHrdBpPresentFlag is equal to 1, the following applies for each AU in the CVS:

[0375] If the AU is an IRAP or GDR AU, a BP SEI message applicable to the operation point shall be associated with the AU.

[0376] Otherwise, if the AU contains a notDiscardablePic, a BP SEI message applicable to the operation point may or may not be associated with the AU.

[0377] Otherwise, the AU shall not be associated with a BP SEI message applicable to the operation point.

[0378] Otherwise (NalHrdBpPresentFlag and VclHrdBpPresentFlag are both equal to 0), no AU in the CVS shall be associated with a BP SEI message.

[0379] NOTE—For some applications, frequent presence of BP SEI messages may be desirable (e.g., for random access at an IRAP picture or a non-IRAP picture or for bitstream splicing).

[0380] bp_nal_hrd_params_present_flag equal to 1 specifies that a list of syntax element pairs nal_initial_cpb_removal_delay[i][j] and nal_initial_cpb_removal_offset[i][j] are present in the BP SEI message. bp_nal_hrd_params_present_flag equal to 0 specifies that no syntax element pairs nal_initial_cpb_removal_delay[i][j] and nal_initial_cpb_removal_offset[i][j] are present in the BP SEI message,

[0381] The value of bp_nal_hrd_params_present_flag shall be equal to general_nal_hrd_params_present_flag.

[0382] bp_vcl_hrd_params_present_flag equal to 1 specifies that a list of syntax element pairs vcl_initial_cpb_removal_delay[i][j] and vcl_initial_cpb_removal_offset[i][j] are present in the BP SEI message. bp_vcl_hrd_params_present_flag equal to 0 specifies that no syntax element pairs vcl_initial_cpb_removal_delay[i][j] and vcl_initial_cpb_removal_offset[i][j] are present in the BP SEI message.

[0383] The value of bp_vcl_hrd_params_present_flag shall be equal to general_vcl_hrd_params_present_flag.

[0384] bp_vcl_hrd_params_present_flag and bp_nal_hrd_params_present_flag in a BP SEI message shall not be both equal to 0.

[0385] initial_cpb_removal_delay_length_minus1 plus 1 specifies the length, in bits, of the syntax elements nal_initial_cpb_removal_delay[i][j], nal_initial_cpb_removal_offset[i][j], vcl_initial_cpb_removal_delay[i][j], and vcl_initial_cpb_removal_offset[i][j] of the BP SEI messages in the current buffering period. When not present, the value of initial_cpb_removal_delay_length_minus1 is inferred to be equal to 23.

[0386] cpb_removal_delay_length_minus1 plus 1 specifies the length, in bits, of the syntax elements cpb_removal_delay_delta_minus1 and cpb_removal_delay_delta[i] in the BP SEI message and the syntax element cpb_removal_delay_minus1[i] in the PT SEI messages in the current buffering period. When not present, the value of cpb_removal_delay_length_minus1 is inferred to be equal to 23.

[0387] dpb_output_delay_length_minus1 plus 1 specifies the length, in bits, of the syntax element dpb_output_delay in the PT SEI messages in the current buffering period. When not present, the value of dpb_output_delay_length_minus1 is inferred to be equal to 23.

[0388] alt_cpb_params_present_flag equal to 1 specifies the presence of the syntax element use_alt_cpb_params_flag in the BP SEI message and the presence of the alternative timing information in the PT SEI messages in the current buffering period. When not present,

the value of `bp_alt_cpb_params_present_flag` is inferred to be equal to 0. When the associated picture is neither a nor CRA picture an IDR picture, the value of `bp_alt_cpb_params_present_flag` shall be equal to 0.

[0389] `bp_decoding_unit_hrd_params_present_flag` equal to 1 specifies that DU level HRD parameters are present and the HRD may operate at AU level or DU level. `bp_decoding_unit_hrd_params_present_flag` equal to 0 specifies that DU level HRD parameters are not present and the HRD operates at AU level. When `bp_decoding_unit_hrd_params_present_flag` is not present, its value is inferred to be equal to 0. The value of `bp_decoding_unit_hrd_params_present_flag` shall be equal to `general_decoding_unit_hrd_params_present_flag`.

[0390] `du_cpb_removal_delay_increment_length_minus1` plus 1 specifies the length, in bits, of the `du_cpb_removal_delay_increment_minus1[][]` and `du_common_cpb_removal_delay_increment_minus1[]` syntax elements of the PT SEI messages in the current buffering period and the `du_spt_cpb_removal_delay_increment[]` syntax element in the DU information SEI messages in the current buffering period. When not present, the value of `du_cpb_removal_delay_increment_length_minus1` is inferred to be equal to 23.

[0391] `dpb_output_delay_du_length_minus1` plus 1 specifies the length, in bits, of the `pic_dpb_output_du_delay` syntax element in the PT SEI messages in the current buffering period and the `pic_spt_dpb_output_du_delay` syntax element in the DU information SEI messages in the current buffering period. When not present, the value of `dpb_output_delay_du_length_minus1` is inferred to be equal to 23.

[0392] `decoding_unit_cpb_params_in_pic_timing_sei_flag` equal to 1 specifies that DU level CPB removal delay parameters are present in PT SEI messages and no DU information SEI message is available (in the CVS or provided through external means not specified in this Specification). `decoding_unit_cpb_params_in_pic_timing_sei_flag` equal to 0 specifies that DU level CPB removal delay parameters are present in DU information SEI messages and PT SEI messages do not include DU level CPB removal delay parameters. When the `decoding_unit_cpb_params_in_pic_timing_sei_flag` syntax element is not present, it is inferred to be equal to 0.

[0393] `concatenation_flag` indicates, when the current picture is not the first picture in the bitstream in decoding order, whether the nominal CPB removal time of the current picture is determined relative to the nominal CPB removal time of the preceding picture with a BP SEI message or relative to the nominal CPB removal time of the picture `prevNonDiscardablePic`.

[0394] `additional_concatenation_info_present_flag` equal to 1 specifies that the syntax element `max_initial_removal_delay_for_concatination` is present in

the BP SEI message and the syntax element `delay_for_concatination_ensured_flag` is present in the PT SEI messages. `additional_concatenation_info_present_flag` equal to 0 specifies that the syntax element `max_initial_removal_delay_for_concatination` is not present in the BP SEI message and the syntax element `delay_for_concatination_ensured_flag` is not present in the PT SEI messages.

[0395] `max_initial_removal_delay_for_concatination` may be used together with `delay_for_concatination_ensured_flag` in a PT SEI message to identify whether the nominal removal time from the CPB of the first AU of a following BP computed with `cpb_removal_delay_delta_minus1` applies. The length of `max_initial_removal_delay_for_concatination` is `initial_cpb_removal_delay_length_minus1+1` bits.

[0396] `cpb_removal_delay_delta_minus1` plus 1, when the current picture is not the first picture in the bitstream in decoding order, specifies a CPB removal delay increment value relative to the nominal CPB removal time of the picture `prevNonDiscardablePic`. The length of this syntax element is `cpb_removal_delay_length_minus1+1` bits.

[0397] When the current picture contains a BP SEI message and `concatenation_flag` is equal to 0 and the current picture is not the first picture in the bitstream in decoding order, it is a requirement of bitstream conformance that the following constraint applies:

[0398] If the picture `prevNonDiscardablePic` is not associated with a BP SEI message, the `cpb_removal_delay_minus1` of the current picture shall be equal to the `cpb_removal_delay_minus1` of `prevNonDiscardablePic` plus `cpb_removal_delay_delta_minus1+1`.

[0399] Otherwise, `cpb_removal_delay_minus1` shall be equal to `cpb_removal_delay_delta_minus1`.

[0400] NOTE—When the current picture contains a BP SEI message and `concatenation_flag` is equal to 1, the `cpb_removal_delay_minus1` for the current picture is not used. The above-specified constraint can, under some circumstances, make it possible to splice bitstreams (that use suitably-designed referencing structures) by simply changing the value of `concatenation_flag` from 0 to 1 in the BP SEI message for an IRAP or GDR picture at the splicing point. When `concatenation_flag` is equal to 0, the above-specified constraint enables the decoder to check whether the constraint is satisfied as a way to detect the loss of the picture `prevNonDiscardablePic`.

[0401] `cpb_removal_delay_deltas_present_flag` equal to 1 specifies that the BP SEI message contains CPB removal delay deltas, `cpb_removal_delay_deltas_present_flag` equal to 0 specifies that no CPB removal delay deltas are present in the BP SEI message.

[0402] `num_cpb_removal_delay_deltas_minus1` plus 1 specifies the number of syntax elements `cpb_removal_delay_delta[i]` in the BP SEI message. The value of

num_cpb_removal_offsets_minus1 shall be in the range of 0 to 15, inclusive.

[0403] cpb_removal_delay_delta[i] specifies the i-th CPB removal delay delta. The length of this syntax element is cpb_removal_delay_length_minus1+1 bits.

[0404] bp_max_sublayers_minus1 plus 1 specifies the maximum number of temporal sublayers for which CPB removal delay and CPB removal offset are indicated in the BP SEI message. The value of bp_max_sublayers_minus1 shall be in the range of 0 to vps_max_sublayers_minus1, inclusive.

[0405] bp_cpb_cnt_minus1 plus 1 specifies the number of syntax element pairs nal_initial_cpb_removal_delay[i][j] and nal_initial_cpb_removal_offset[i][j] of the i-th temporal sublayer when bp_nal_hrd_params_present_flag is equal to 1, and the number of syntax element pairs vcl_initial_cpb_removal_delay[i][j] and vcl_initial_cpb_removal_offset[i][j] of the i-th temporal sublayer when bp_vcl_hrd_params_present_flag is equal to 1. The value of bp_cpb_cnt_minus1 shall be in the range of 0 to 31, inclusive.

[0406] The value of bp_cpb_cnt_minus1 shall be equal to the value of hrd_cpb_cnt_minus1.

[0407] sublayer_initial_cpb_removal_delay_present_flag equal to 1 specifies that initial CPB removal delay related syntax elements are present for temporal sublayer representation(s) in the range of 0 to bp_max_sublayers_minus1, inclusive. sublayer_initial_cpb_removal_delay_present_flag equal to 0 specifies that initial CPB removal delay related syntax elements are present for the bp_max_sublayers_minus1-th temporal sublayer representation.

[0408] nal_initial_cpb_removal_delay[i][j] and nal_initial_alt_cpb_removal_delay[i][j] specify the j-th default and alternative initial CPB removal delay for the NAL HRD in units of a 90 kHz clock of the i-th temporal sublayer. The length of nal_initial_cpb_removal_delay[i][j] and nal_initial_alt_cpb_removal_delay[i][j] is initial_cpb_removal_delay_length_minus1+1 bits. The value of nal_initial_cpb_removal_delay[i][j] and nal_initial_alt_cpb_removal_delay[i][j] shall not be equal to 0 and shall be less than or equal to $90000 * (\text{CpbSize}[i][j] + \text{BitRate}[i][j])$, the time-equivalent of the CPB size in 90 kHz clock units. When not present, the values of nal_initial_cpb_removal_delay[i][j] and nal_initial_alt_cpb_removal_delay[i][j] are inferred to be equal to $90000 * (\text{CpbSize}[i][j] + \text{BitRate}[i][j])$.

[0409] nal_initial_cpb_removal_offset[i][j] and nal_initial_alt_cpb_removal_offset[i][j] specify the j-th default and alternative initial CPB removal offset of the i-th temporal sublayer for the NAL HRD in units of a 90 kHz clock. The length of nal_initial_cpb_removal_offset[i][j] and nal_initial_alt_cpb_removal_offset[i][j] is initial_cpb_removal_delay_length_minus1+1 bits. When not present, the values of nal_initial_cpb_removal_offset[i][j] and nal_initial_alt_cpb_removal_offset[i][j] are inferred to be equal to 0.

al_offset[i][j] and nal_initial_alt_cpb_removal_offset[i][j] are inferred to be equal to 0.

[0410] Over the entire CVS, for each value pair of i and j, the sum of nal_initial_cpb_removal_delay[i][j] and nal_initial_cpb_removal_offset[i][j] shall be constant, and the sum of nal_initial_alt_cpb_removal_delay[i][j] and nal_initial_alt_cpb_removal_offset[i][j] shall be constant.

[0411] vcl_initial_cpb_removal_delay[i][j] and vcl_initial_alt_cpb_removal_delay[i][j] specify the j-th default and alternative initial CPB removal delay of the i-th temporal sublayer for the VCL HRD in units of a 90 kHz clock. The length of vcl_initial_cpb_removal_delay[i][j] and vcl_initial_alt_cpb_removal_delay[i][j] is initial_cpb_removal_delay_length_minus1+1 bits. The value of vcl_initial_cpb_removal_delay[i][j] and vcl_initial_alt_cpb_removal_delay[i][j] shall not equal to 0 and be shall less than or equal to $90000 * (\text{CpbSize}[i][j] + \text{BitRate}[i][j])$, the time-equivalent of the CPB size in 90 kHz clock units. When not present, the values of vcl_initial_cpb_removal_delay[i][j] and vcl_initial_alt_cpb_removal_delay[i][j] are inferred to be equal to $90000 * (\text{CpbSize}[i][j] + \text{BitRate}[i][j])$.

[0412] vcl_initial_cpb_removal_offset[i][j] and vcl_initial_alt_cpb_removal_offset[i][j] specify the j-th default and alternative initial CPB removal offset of the i-th temporal sublayer for the VCL HRD in units of a 90 kHz clock. The length of vcl_initial_cpb_removal_offset[i][j] and vcl_initial_alt_cpb_removal_offset[i][j] is initial_cpb_removal_delay_length_minus1+1 bits. When not present, the values of vcl_initial_cpb_removal_offset[i][j] and vcl_initial_alt_cpb_removal_offset[i][j] are inferred to be equal to 0.

[0413] Over the entire CVS, for value pair of i and j of each the sum of vcl_initial_cpb_removal_delay[i][j] and vcl_initial_cpb_removal_offset[i][j] shall be constant, and the sum of vcl_initial_alt_cpb_removal_delay[i][j] and vcl_initial_alt_cpb_removal_offset[i][j] shall be constant.

[0414] use_alt_cpb_params_flag may be used to derive the value of UseAltCpbParamsFlag. When use_alt_cpb_params_flag is not present, it is inferred to be equal to 0.

[0415] When one or more of the following conditions apply, UseAltCpbParamsFlag is set to 1:

[0416] use_alt_cpb_params_flag is equal to 1.

[0417] When some external means not specified in this Specification is available to set UseAltCpbParamsFlag and the value of UseAltCpbParamsFlag is set equal to 1 by the external means.

[0418] As described above, JVET-P2001 enables SEI messages to be signaled which assist in processes related to decoding, display or other purposes. Further, a type of SEI message for VCL HRD operations includes picture timing SEI messages. Table 9 illustrates the pic_timing() syntax structure provided in JVET-P2001.

TABLE 9

}	

[0419] With respect to Table 9, JVET-P2001 provides the following semantics:

[0420] The PT SEI message provides CPB removal delay and DPB output delay information for the AU associated with the SEI message.

[0421] If `bp_nal_hrd_params_present_flag` or `bp_vel_hrd_params_present_flag` of the BP SEI message applicable for the current AU is equal to 1, the variable `CpbDpbDelaysPresentFlag` is set equal to 1. Otherwise, `CpbDpbDelaysPresentFlag` is set equal to 0.

[0422] The presence of PT SEI messages is specified as follows:

[0423] If `CpbDpbDelaysPresentFlag` is equal to 1, a PT SEI message shall be associated with the current AU.

[0424] Otherwise (`CpbDpbDelaysPresentFlag` is equal to 0), there shall not be a PT SEI message associated with the current AU.

[0425] The `TemporalId` in the PT SEI message syntax is the `TemporalId` of the SEI NAL unit containing the PT SEI message.

[0426] `cpb_removal_delay_minus1[i]` plus 1 is used to calculate the number of clock ticks between the nominal CPB removal times of the AU associated with the PT SEI message and the preceding AU in decoding order that contains a BP SEI message when `Htid` is equal to `i`. This value is also used to calculate an earliest possible time of arrival of AU data into the CPB for the HSS. The length of `cpb_removal_delay_minus1[i]` is `cpb_removal_delay_length_minus1+1` bits.

[0427] `cpb_alt_timing_info_present_flag` equal to 1 specifies the presence of the syntax elements `cpb_alt_initial_cpb_removal_delay_delta[i]`, `cpb_delay_offset`, and `dpb_delay_offset`. When the associated picture is a RASL picture, the value of `cpb_alt_timing_info_present_flag` shall be equal to 0.

[0428] NOTE—The value of `cpb_alt_timing_info_present_flag` might be equal to 1 for more than one AU following an IRAP picture in decoding order. However, the alternative timing is only applied to the first AU that has `cpb_alt_timing_info_present_flag` equal to 1 and follows the IRAP picture in decoding order.

- [0429] `cpb_alt_initial_cpb_removal_delay_delta[i]` specifies the alternative initial CPB removal delay delta for the *i*-th CPB. The length of `cpb_alt_initial_cpb_removal_delay_delta[i]` is `initial_cpb_removal_delay_length_minus1+1` bits.
- [0430] `cpb_alt_initial_cpb_removal_offset_delta[i]` specifies the alternative initial CPB removal offset delta for the *i*-th CPB. The length of `cpb_alt_initial_cpb_removal_offset_delta[i]` is `initial_cpb_removal_delay_length_minus1+1` bits.
- [0431] `cpb_delay_offset` specifies an offset to be used in the derivation of the nominal CPB removal times of the AU associated with the PT SEI message and of the AUs following in decoding order, when the AU associated with the PT SEI message directly follows in decoding order the AU associated with the BP SEI message. The length of `cpb_delay_offset` is `au_cpb_removal_delay_length_minus1+1` bits. When not present, the value of `cpb_delay_offset` is inferred to be equal to 0.
- [0432] `dpb_delay_offset` specifies an offset to be used in the derivation of the DPB output times of the IRAP AU associated with the BP SEI message when the AU associated with the PT SEI message directly follows in decoding order the IRAP AU associated with the BP SEI message. The length of `dpb_delay_offset` is `dpb_output_delay_length_minus1+1` bits. When not present, the value of `dpb_delay_offset` is inferred to be equal to 0.

```

cpbRemovalDelayValTmp[ i ] = cpb_removal_delay_delta_enabled_flag[ i ] ?
    cpb_removal_delay_minus1[ sps_max_sublayers_minus1 ] + 1 +
    cpb_removal_delay_delta[ cpb_removal_delay_delta_idx[ i ] ] : cpb_removal_delay_minus1[ i ] + 1
if( prevBpResetFlag )
    CpbRemovalDelayMsb[ i ] = 0
else if( cpbRemovalDelayValTmp[ i ] < prevCpbRemovalDelayMinus1[ i ] )
    CpbRemovalDelayMsb[ i ] = prevCpbRemovalDelayMsb[ i ] + 2cpb_removal_delay_length_minus1 + 1
else
    CpbRemovalDelayMsb[ i ] = prevCpbRemovalDelayMsb[ i ]

```

- [0433] The variable `BpResetFlag` of the current picture is derived as follows:
- [0434] 1 If the current picture is associated with a BP SEI message, `BpResetFlag` is set equal to 1.
- [0435] Otherwise, `BpResetFlag` is set equal to 0.
- [0436] `pt_sublayer_delays_present_flag[i]` equal to 1 specifies that `cpb_removal_delay_delta_idx[i]`, `cpb_removal_delay_minus1[i]`, and that `du_common_cpb_removal_delay_increment_minus1[i]` or `du_cpb_removal_delay_increment_minus1[i]` are present for the sublayer with `TemporalId` equal to *i*. `sublayer_delays_present_flag[i]` equal to 0 specifies that neither `cpb_removal_delay_delta_idx[i]` nor `cpb_removal_delay_minus1[i]` and that neither `du_common_cpb_removal_delay_increment_minus1[i]` nor `du_cpb_removal_delay_increment_minus1[i]` are present for the sublayer with `TemporalId` equal to *i*. The value of `pt_sublayer_delays_present_flag[bp_max_sublayers_minus1]` is inferred to be equal to 1. When not present, the value of `pt_sublayer_delays_present_flag[i]` for any *i* in the range of 0 to `bp_max_sublayers_minus1-1`, inclusive, is inferred to be equal to 0.
- [0437] `cpb_removal_delay_delta_enabled_flag[i]` equal to 1 specifies that `cpb_removal_delay_delta_idx[i]` is present in the PT SEI message. `cpb_removal_delay_`

`delta_enabled_flag[i]` equal to 0 specifies that `cpb_removal_delay_delta_idx[i]` is not present in the PT SEI message. When not present, the value of `cpb_removal_delay_delta_enabled_flag[i]` is inferred to be equal to 0.

- [0438] `cpb_removal_delay_delta_idx[i]` specifies the index of the CPB removal delta that applies to `Htid` equal to *i* in the list of `cpb_removal_delay_delta[j]` for *j* ranging from 0 to `num_cpb_removal_delay_deltas_minus1`, inclusive. The length of `cpb_removal_delay_delta_idx[i]` is `Ceil(Log2(num_cpb_removal_delay_deltas_minus1+1))` bits.
- [0439] The variables `CpbRemovalDelayMsb[i]` and `CpbRemovalDelayVal[i]` of the current picture are derived as follows:
- [0440] If the current AU is the AU that initializes the HRD, `CpbRemovalDelayMsb[i]` and `CpbRemovalDelayVal[i]` are both set equal to 0, and the value of `cpbRemovalDelayValTmp[i]` is set equal to `cpb_removal_delay_minus1[i]+1`.
- [0441] Otherwise, let the picture `prevNonDiscardablePic` be the previous picture in decoding order that has `TemporalId` equal to 0 that is not a RASL or RADL, let `prevCpbRemovalDelayMinus1[i]`, `prevCpbRemovalDelayMsb[i]`, and `prevBpResetFlag` be set equal to the values of `cpbRemovalDelayValTmp[i]-1`, `CpbRemovalDelayMsb[i]`, and `BpResetFlag`, respectively, for the picture `prevNonDiscardablePic`, and the following applies:
- [0442] `CpbRemovalDelayMsb[i]` is derived as follows:

- [0443] `CpbRemovalDelayVal` is derived as follows:

$$CpbRemovalDelayVal[i] =$$

$$CpbRemovalDelayMsb[i] + cpbRemovalDelayValTmp[i]$$

- [0444] The value of `CpbRemovalDelayVal[i]` shall be in the range of 1 to 2^{32} , inclusive.
- [0445] The variable `picDpbOutputDelta[i]` is derived as follows:
- [0446] If `pt_sublayer_delays_present_flag[i]` is equal to 0, `picDpbOutputDelta[i]` is set equal to 0.
- [0447] Otherwise (`pt_sublayer_delays_present_flag[i]` is equal to 1), `picDpbOutputDelta[i]` is set equal to `CpbRemovalDelayVal[i]-(cpb_removal_delay_minus1[sps_max_sublayers_minus1]+1)`.
- [0448] `dpb_output_delay` is used to compute the DPB output time of the picture. It specifies how many clock ticks to wait after removal of an AU from the CPB before the decoded picture is output from the DPB.

- [0449] NOTE—A picture is not removed from the DPB at its output time when it is still marked as “used for short-term reference” or “used for long-term reference”.
- [0450] The length of `dpb_output_delay` is `dpb_output_delay_length_minus1+1` bits. When `max_dec_pic_buffering_minus1[Htid]` is equal to 0, the value of `pic_dpb_output_delay` shall be equal to 0.
- [0451] The output time derived from the `dpb_output_delay` of any picture that is output from an output timing conforming decoder shall precede the output time derived from the `dpb_output_delay` of all pictures in any subsequent CVS in decoding order.
- [0452] The picture output order established by the values of this syntax element shall be the same order as established by the values of `PicOrderCntVal`.
- [0453] For pictures that are not output by the “bumping” process because they precede, in decoding order, a CLVSS picture that has `no_output_of_prior_pics_flag` equal to 1 or inferred to be equal to 1, the output times derived from `dpb_output_delay` shall be increasing with increasing value of `PicOrderCntVal` relative to all pictures within the same CVS.
- [0454] `pic_dpb_output_du_delay` is used to compute the DPB output time of the picture when `DecodingUnitHrdFlag` is equal to 1. It specifies how many sub clock ticks to wait after removal of the last DU in an AU from the CPB before the decoded picture is output from the DPB. The length of the syntax element `pic_dpb_output_du_delay` is given in bits by `dpb_output_delay_du_length_minus1+1`.
- [0455] The output time derived from the `pic_dpb_output_du_delay` of any picture that is output from an output timing conforming decoder shall precede the output time derived from the `pic_dpb_output_du_delay` of all pictures in any subsequent CVS in decoding order.
- [0456] The picture output order established by the values of this syntax element shall be the same order as established by the values of `PicOrderCntVal`.
- [0457] For pictures that are not output by the “bumping” process because they precede, in decoding order, a CLVSS picture that has `no_output_of_prior_pics_flag` equal to 1 or inferred to be equal to 1, the output times derived from `pic_dpb_output_du_delay` shall be increasing with increasing value of `PicOrderCntVal` relative to all pictures within the same CVS.
- [0458] For any two pictures in the CVS, the difference between the output times of the two pictures when `DecodingUnitHrdFlag` is equal to 1 shall be identical to the same difference when `DecodingUnitHrdFlag` is equal to 0.
- [0459] `num_decoding_units_minus1` plus 1 specifies the number of DUs in the AU the PT SEI message is associated with. The value of `num_decoding_units_minus1` shall be in the range of 0 to `PicSizeInCtbsY-1`, inclusive.
- [0460] `du_common_cpb_removal_delay_flag` equal to 1 specifies that the syntax elements `du_common_cpb_removal_delay_increment_minus1[i]` are present. `du_common_cpb_removal_delay_flag` equal to 0 specifies that the syntax elements `du_common_cpb_removal_delay_increment_minus1[i]` are not present.
- [0461] `du_common_cpb_removal_delay_increment_minus1[i]` plus 1 specifies the duration, in units of clock sub-ticks, between the nominal CPB removal times of any two consecutive DUs in decoding order in the AU associated with the PT SEI message when `Htid` is equal to `i`. This value is also used to calculate an earliest possible time of arrival of DU data into the CPB for the HSS, as specified. The length of this syntax element is `du_cpb_removal_delay_increment_length_minus1+1` bits.
- [0462] When `du_common_cpb_removal_delay_increment_minus1[i]` is not present for any value of `i` less than `bp_max_sublayers_minus1`, its value is inferred to be equal to `du_common_cpb_removal_delay_increment_minus1[bp_max_sublayers_minus1]`.
- [0463] `num_nalus_in_du_minus1[i]` plus 1 specifies the number of NAL units in the `i`-th DU of the AU the PT SEI message is associated with. The value of `num_nalus_in_du_minus1[i]` shall be in the range of 0 to `PicSizeInCtbsY-1`, inclusive.
- [0464] The first DU of the AU consists of the first `num_nalus_in_du_minus1[0]+1` consecutive NAL units in decoding order in the AU. The `i`-th (with `i` greater than 0) DU of the AU consists of the `num_nalus_in_du_minus1[i]+1` consecutive NAL units immediately following the last NAL unit in the previous DU of the AU, in decoding order. There shall be at least one VCL NAL unit in each DU. All non-VCL NAL units associated with a VCL NAL unit shall be included in the same DU as the VCL NAL unit.
- [0465] `du_cpb_removal_delay_increment_minus1[i][j]` plus 1 specifies the duration, in units of clock sub-ticks, between the nominal CPB removal times of the `(i+1)`-th DU and the `i`-th DU, in decoding order, in the AU associated with the PT SEI message when `Htid` is equal to `j`. This value is also used to calculate an earliest possible time of arrival of DU data into the CPB for the HSS. The length of this syntax element is as specified.
- [0466] `du_cpb_removal_delay_increment_length_minus1+1` bits.
- [0467] When `du_cpb_removal_delay_increment_minus1[i][j]` is not present for any value of `j` less than `bp_max_sublayers_minus1`, its value is inferred to be equal to `du_cpb_removal_delay_increment_minus1[i][bp_max_sublayers_minus1]`.
- [0468] `delay_for_concatenation_ensured_flag` equal to 1 specifies that the difference between the final arrival time and the CPB removal time of the AU associated with the PT SEI message is such that when followed by an AU with a BP SEI message with `concatenation_flag` equal to 1 and `InitCpbRemovalDelay[][]` less than or equal to the value of `max_initial_removal_delay_for_concatenation`, the nominal removal time of the following AU from the CPB computed with `cpb_removal_delay_delta_minus1` applies. `delay_for_concatenation_ensured_flag` equal to 0 specifies that the difference between the final arrival time and the CPB removal time of the AU associated with the PT SEI message may or may not exceed the value of `max_val_initial_removal_delay_for_splicing`.
- [0469] As described above, JVET-P2001 enables SEI messages to be signaled which assist in processes related to decoding, display or other purposes. Further, a type of SEI message for VCL HRD operations

includes decoding unit information SEI messages. Table 10 illustrates the `decoding_unit_info()` syntax structure provided in JVET-P2001.

include at least one VCL NAL unit. All non-VCL NAL units associated with a VCL NAL unit shall be included in the DU containing the VCL NAL unit.

[0470] With respect to Table 10, JVET-P2001 provides the following semantics:

[0471] The DU information SEI message provides CPB removal delay information for the DU associated with the SEI message.

[0472] The following applies for the DU information SEI message syntax and semantics:

[0473] The syntax elements `bp_decoding_unit_hrd_params_present_flag`, `decoding_unit_cpb_params_in_pic_timing_sei_flag` and `dpb_output_delay_du_length_minus1` are found in the BP SEI message that is applicable to at least one of the operation points to which the DU information SEI message applies.

[0474] The bitstream (or a part thereof) refers to the bitstream subset (or a part thereof) associated with any of the operation points to which the DU information SEI message applies.

[0475] The presence of DU information SEI messages for an operation point is specified as follows:

[0476] If `CpbDpbDelaysPresentFlag` is equal to 1, `bp_decoding_unit_hrd_params_present_flag` is equal to 1 and `decoding_unit_cpb_params_in_pic_timing_sei_flag` is equal to 0, one or more DU information SEI messages applicable to the operation point shall be associated with each DU in the CVS.

[0477] Otherwise, if `CpbDpbDelaysPresentFlag` is equal to 1, `bp_decoding_unit_hrd_params_present_flag` is equal to 1 and `decoding_unit_cpb_params_in_pic_timing_sei_flag` is equal to 1, one or more DU information SEI messages applicable to the operation point may or may not be associated with each DU in the CVS.

[0478] Otherwise (`CpbDpbDelaysPresentFlag` is equal to 0 or `bp_decoding_unit_hrd_params_present_flag` is equal to 0), in the CVS there shall be no DU that is associated with a DU information SEI message applicable to the operation point.

[0479] The set of NAL units associated with a DU information SEI message consists, in decoding order, of the SEI NAL unit containing the DU information SEI message and all subsequent NAL units in the AU up to but not including any subsequent SEI NAL unit containing a DU information SEI message with a different value of `decoding_unit_idx`. Each DU shall

[0480] The `TemporalId` in the DU information SEI message syntax is the `TemporalId` of the SEI NAL unit containing the DU information SEI message.

[0481] `decoding_unit_idx` specifies the index, starting from 0, to the list of DUs in the current AU, of the DU associated with the DU information SEI message. The value of `decoding_unit_idx` shall be in the range of 0 to `PicSizeInCtbsY-1`, inclusive.

[0482] A DU identified by a particular value of `duIdx` includes and only includes all NAL units associated with all DU information SEI messages that have `decoding_unit_idx` equal to `duIdx`. Such a DU is also referred to as associated with the DU information SEI messages having `decoding_unit_idx` equal to `duIdx`.

[0483] For any two DUs `duA` and `duB` in one AU with `decoding_unit_idx` equal to `duIdxA` and `duIdxB`, respectively, where `duIdxA` is less than `duIdxB`, `duA` shall precede `duB` in decoding order.

[0484] A NAL unit of one DU shall not be present, in decoding order, between any two NAL units of another DU.

[0485] `dui_sublayer_delays_present_flag[i]` equal to 1 specifies that `du_spt_cpb_removal_delay_increment[i]` is present for the sublayer with `TemporalId` equal to `i`. `dui_sublayer_delays_present_flag[i]` equal to 0 specifies that `du_spt_cpb_removal_delay_increment[i]` is not present for the sublayer with `TemporalId` equal to `i`. When not present, the value of `dui_sublayer_delays_present_flag[i]` is inferred to be equal to 0.

[0486] `du_spt_cpb_removal_delay_increment[i]` specifies the duration, in units of clock sub-ticks, between the nominal CPB times of the last DU in decoding order in the current AU and the DU associated with the DU information SEI message when `Htid` is equal to `i`. This value is also used to calculate an earliest possible time of arrival of DU data into the CPB for the HSS, as specified in Annex C. The length of this syntax element is `du_cpb_removal_delay_increment_length_minus1+1`. When the DU associated with the DU information SEI message is the last DU in the current AU, the value of `du_spt_cpb_removal_delay_increment[i]` shall be equal to 0. When `du_spt_cpb_removal_delay_increment[i]` is not present for any value of `i` less than

bp_max_sublayers_minus1, its value is inferred to be equal to du_spt_cpb_removal_delay_increment[bp_max_sublayers_minus1].

follows, where the variable firstPicInBufferingPeriodFlag is equal to 1 if AU n is the first AU of a BP and 0 otherwise:

```

if( !DecodingUnitHrdFlag ) {
    DpbOutputTime[ n ] = CpbRemovalTime[ n ] + ClockTick * ( picDpbOutputDelay -
        picDpbOutputDelta )
    if( firstPicInBufferingPeriodFlag )
        DpbOutputTime[ n ] -= ClockTick * DpbDelayOffset
    } else
        DpbOutputTime[ n ] = AuCpbRemovalTime[ n ] + ClockSubTick * picSptDpbOutputDuDelay

```

[0487] dpb_output_du_delay_present_flag equal to 1 specifies the presence of the pic_spt_dpb_output_du_delay syntax element in the DU information SEI message. dpb_output_du_delay_present_flag equal to 0 specifies the absence of the pic_spt_dpb_output_du_delay syntax element in the DU information SEI message.

[0488] pic_spt_dpb_output_du_delay is used to compute the DPB output time of the picture when DecodingUnitHrdFlag is equal to 1. It specifies how many sub clock ticks to wait after removal of the last DU in an AU from the CPB before the decoded picture is output from the DPB. When not present, the value of pic_spt_dpb_output_du_delay is inferred to be equal to pic_dpb_output_du_delay. The length of the syntax element pic_spt_dpb_output_du_delay is given in bits by dpb_output_delay_du_length_minus1+1.

[0489] It is a requirement of bitstream conformance that all DU information SEI messages that are associated with the same AU, apply to the same operation point, and have dpb_output_du_delay_present_flag equal to 1 shall have the same value pic_spt_dpb_output_du_delay.

[0490] The output time derived from the pic_spt_dpb_output_du_delay of any picture that is output from an output timing conforming decoder shall precede the output time derived from the pic_spt_dpb_output_du_delay of all pictures in any subsequent CVS in decoding order. The picture output order established by the values of this syntax element shall be the same order as established by the values of PicOrderCntVal.

[0491] For pictures that are not output by the “bumping” process because they precede, in decoding order, a CLVSS picture that has no_output_of_prior_pics_flag equal to 1 or inferred to be equal to 1, the output times derived from pic_spt_dpb_output_du_delay shall be increasing with increasing value of PicOrderCntVal relative to all pictures within the same CVS.

[0492] For any two pictures in the CVS, the difference between the output times of the two pictures when DecodingUnitHrdFlag is equal to 1 shall be identical to the same difference when DecodingUnitHrdFlag is equal to 0.

[0493] Further, JVET-P2001, provides the following for picture output for a decoding picture buffer:

[0494] The processes specified in this clause happen instantaneously at the CPB removal time of AU n, CpbRemovalTime[n].

[0495] When picture n has PictureOutputFlag equal to 1, its DPB output time DpbOutputTime[n] is derived as

[0496] where picDpbOutputDelay is the value of pic_dpb_output_delay and picDpbOutputDelta is the value of picDpbOutputDelta[Htid] derived according to epb_removal_delay_minus1[Htid], and cpb_removal_delay_delta_idx[Htid] in the PT SEI message associated with AU n, and cpb_removal_delay_delta[cpb_removal_delay_delta_idx[Htid]] in the BP SEI message associated with AU n, and picSptDpbOutputDuDelay the of is value pic_spt_dpb_output_du_delay, when present, in the DU information SEI messages associated with AU n, or the value of pic_dpb_output_du_delay in the PT SEI message associated with AU n when there is no DU information SEI message associated with AU n or no DU information SEI message associated with AU n has pic_spt_dpb_output_du_delay present.

[0497] NOTE—When the syntax element pic_spt_dpb_output_du_delay is not present in any DU information SEI message associated with AU n, the value is inferred to be equal to pic_dpb_output_du_delay in the PT SEI message associated with AU n.

[0498] The output of the current picture is specified as follows:

[0499] If PictureOutputFlag is equal to 1 and DpbOutputTime[n] is equal to CpbRemovalTime[n], the current picture is output.

[0500] Otherwise, if PictureOutputFlag is equal to 0, the current picture is not output, but will be stored in the DPB as specified in the clause below.

[0501] Otherwise (PictureOutputFlag is equal to 1 and DpbOutputTime[n] is greater than CpbRemovalTime[n]), the current picture is output later and will be stored in the DPB (as specified below) and is output at time DpbOutputTime[n] unless indicated not to be output by NoOutputOfPriorPicsFlag equal to 1.

[0502] When output, the picture is cropped, using the conformance cropping window for the picture. When picture n is a picture that is output and is not the last picture of the bitstream that is output, the value of the variable DpbOutputInterval[n] is derived as follows:

$$\text{DpbOutputInterval}[n] = \text{DpbOutputTime}[\text{nextPicInOutputOrder}] - \text{DpbOutputTime}[n]$$

[0503] where nextPicInOutputOrder is the picture that follows picture n in output order and has PictureOutputFlag equal to 1.

[0504] The current decoded picture is stored in the DPB in an empty picture storage buffer, the DPB fullness is incremented by one, and the current picture is marked as “used for short-term reference”.

[0505] NOTE—Unless more memory than required by the level limit is available for storage of decoded pictures, decoders should start storing decoded parts of the current picture into the DPB when the first slice is decoded and continue storing more decoded samples as the decoding process proceeds.

[0506] The signaling of syntax elements `pic_dpb_output_du_delay` and `pic_spt_dpb_output_du_delay` in JVET-P2001 is less than ideal. In particular, if DU level HRD parameters are present (i.e., `bp_decoding_unit_hrd_params_present_flag` is equal to 1), picture dpb output delay information (i.e. `pic_dpb_output_du_delay`) is always signalled in picture timing SEI message. Additionally, the picture dpb output delay information can be signalled in each of the one or more DU information SEI messages in syntax element `pic_spt_dpb_output_du_delay`, if `dpb_output_du_delay_present_flag` is equal to 1. If the picture dpb output delay information is signaled in DU information SEI messages, the value signalled shall be the same. It is asserted that this way of information signalling about picture DPB output delay is unnecessarily redundant and overly complicated. According to the techniques herein, simplification is proposed for signalling picture DPB output delay information. In one example, according to the techniques herein, if DU level HRD parameters are present, a flag is signalled in Buffering period SEI message (or picture timing SEI message) to control if DU level picture DPB output delay information is signalled only in picture timing SEI message or in DU information SEI message. In addition, in one example, an additional flag is signaled in picture timing SEI message (or in buffering period SEI message) to indicate that when DU level picture DPB output delay information is signalled in picture timing SEI message it may be updated in DU information SEI message. In one example, a flag is signalled in buffering period SEI message (or in picture timing SEI message) specifying if DU level picture DPB output delay information is signalled or is inferred to be same as the information for AU level.

1. A method of decoding a picture timing message, the method comprising:

- receiving a buffering period message;
- parsing a first syntax element in the buffering period message, wherein the first syntax element specifies whether a list of syntax element pairs specifying an initial coded picture buffer removal delay and an initial coded picture buffer removal offset are present in the buffering period message;
- receiving the picture timing message;
- parsing a second syntax element in the picture timing message in a case that a value of the first syntax

- element is equal to one, wherein the second syntax element specifies an initial coded picture buffer removal delay delta; and

- parsing a third syntax element in the picture timing message in a case that the value of the first syntax element is equal to one, wherein the third syntax element specifies an initial coded picture buffer removal offset delta.

2. A decoder for decoding coded data, the decoder comprising:

- a processor; and
- a memory associated with the processor, wherein the processor is configured to:
 - receive a buffering period message;
 - parse a first syntax element in the buffering period message, wherein the first syntax element specifies whether a list of element pairs specifying an initial coded picture buffer removal delay and an initial coded picture buffer removal offset are present in the buffering period message;

- receive the picture timing message;

- parse a second syntax element in the picture timing message in a case that a value of the first syntax element is equal to one, wherein the second syntax element specifies an initial coded picture buffer removal delay delta; and

- parse a third syntax element in the picture timing message in a case that the value of the first syntax element is equal to one, wherein the third syntax element specifies an initial coded picture buffer removal offset delta.

3. An encoder for encoding image data, the encoder comprising:

- a processor; and
- a memory associated with the processor, wherein the processor is configured to:
 - signal a buffering period message,
 - wherein the buffering period message includes a first syntax element, wherein the first syntax element specifies whether a list of syntax element pairs specifying an initial coded picture buffer removal delay and an initial coded picture buffer removal offset are present in the buffering period message; and

- signal the picture timing message,

- wherein the picture timing message includes:

- a second syntax element in a case that a value of the first syntax element is equal to one, wherein the second syntax element specifies an initial coded picture buffer removal delay delta, and

- a third syntax element in a case that a value of the first syntax element is equal to one, wherein the third syntax element specifies an initial coded picture buffer removal offset delta.
