| United States Patent | 12383545 |
| Kind Code | B1 |
| Date of Patent | August 12, 2025 |
| Inventor(s) | Trugman; Joel M. et al. |

Treatment of migraine

Abstract

The present disclosure provides methods for the treatment of migraine by the administration of atogepant or a pharmaceutically acceptable salt thereof.

| | |
|-------------------|---|
| Inventors: | Trugman; Joel M. (Hoboken, NJ), Finnegan; Michelle (Madison, NJ) |
| Applicant: | Allergan Pharmaceuticals International Limited (Dublin, IE) |
| Family ID: | 1000008563641 |
| Assignee: | Allergan Pharmaceuticals International Limited (Dublin, IE) |
| Appl. No.: | 19/092662 |
| Filed: | March 27, 2025 |

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS (1) This application is a Continuation-in-Part of U.S. application Ser. No. 18/768,496, filed Jul. 10, 2024; which is a continuation of U.S. application Ser. No. 17/389,223, filed Jul. 29, 2021; which claims the benefit of Provisional Application No. 63/103,353, filed Jul. 29, 2020; Provisional Application No. 63/070,449, filed Aug. 26, 2020; Provisional Application 63/087,175, filed Oct. 2, 2020; Provisional Application No. 63/092,211, filed Oct. 15, 2020; Provisional Application No. 63/129,362, filed Dec. 22, 2020; and Provisional Application No. 63/201,254, filed Apr. 20, 2021. This application is also a Continuation-in-Part of U.S. application Ser. No. 16/433,298, filed Jun. 6, 2019; which claims the benefit of Provisional Application No. 62/682,656, filed Jun. 8, 2018. The entire contents of each of these applications is incorporated herein by reference.

FIELD

(1) The present disclosure is related to medicaments and methods for treating migraine.

BACKGROUND

(2) Migraine is a highly prevalent, severe, and disabling neurological condition with a significant unmet need for effective treatments. (Holland, P. R. & Goadsby, P. J. Neurotherapeutics (2018). Migraine affects over 1 billion people worldwide, and it was reported as the second leading cause of disability in the 2016 Global Burden of Disease study. See GBD 2019 Diseases and Injuries Collaborators. Global Burden of 369 diseases and injuries in 204 countries and territories, 1990-2019: a systemic analysis for the Global Burden of Disease Study 2019, Lancet 2020; 396:1204-22.

(3) When attacks are frequent or disabling, prevention becomes a focus of migraine treatment. Current preventive treatments for migraine include oral medications, such as valproic acid, flunarizine, topiramate, and propranolol, as well as injectable treatments, such as monoclonal antibodies targeting calcitonin gene-related peptide (CGRP).

(4) Currently available CGRP-targeted preventive treatments are limited to monoclonal antibodies, administered by injection. Oral CGRP treatments are approved for acute but not preventive treatment, and yet patients and physicians overwhelmingly prescribe oral migraine preventives, suggesting a treatment gap. There remains a need for optimized and targeted methodologies and dosing regimens to use oral CGRP treatments to prophylactically treat migraines.

SUMMARY

(5) In embodiments, the present disclosure provides methods of prophylactically treating migraine, involving administering atogepant or a pharmaceutically acceptable salt thereof in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, to a patient in need of treatment.

(6) In embodiments, the present disclosure provides methods of prophylactically treating migraine,

involving administering atogepant or a pharmaceutically acceptable salt thereof in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, wherein treatment with atogepant results in a reduction in mean monthly migraine days of at least 3.6 days, or at least 3.8 days, or at least 4.2 days, relative to no treatment.

(7) In embodiments, the present disclosure provides a method of prophylactically treating migraine, involving administering atogepant or a pharmaceutically acceptable salt thereof in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, wherein the prophylactic treatment results in a reduction in mean monthly headache days of at least 3.9 days, or at least 4 days, or at least 4.2 days relative to no treatment.

(8) In embodiments, the present disclosure provides a method of prophylactically treating migraine, involving administering atogepant or a pharmaceutically acceptable salt thereof in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, wherein the prophylactic treatment results in a reduction in mean monthly acute medication use days of at least 3.6 days, or at least 3.8 days relative to no treatment.

(9) In embodiments, the present disclosure provides methods of prophylactically treating migraine, involving administering atogepant or a pharmaceutically acceptable salt thereof in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, wherein the prophylactic treatment results in at least 50% reduction in monthly migraine days relative to no treatment.

Description

BRIEF DESCRIPTION OF THE FIGURES

(1) FIGS. 1 and 2 show the least square mean (\pm standard error of the least squares (SE)) of change from baseline in monthly migraine days (MMRM—mixed effects model for repeated measures) during the double-blind treatment period for the mITT population in Study A. There was a significant reduction in mean monthly migraine days across all three atogepant doses.

(2) FIG. 3 shows the distribution of change from baseline in monthly migraine days across 12 weeks by treatment group. A treatment benefit over placebo for all doses of atogepant is seen across a range of changes from baseline in mean monthly migraine days.

(3) FIG. 4 shows the LS mean change from baseline in monthly migraine days across 12 weeks by treatment group.

(4) FIG. 5A shows the mean change from baseline in weekly migraine days during the first month (weeks 1-4) by treatment group. FIG. 5B shows the proportion of participants with a migraine each day during the first week of treatment (mITT population). Atogepant provided an early and sustained reduction in migraine days including statistically significant reductions in each of the three 4-week intervals, each week during the first 4-week interval, and as early as the first full day after study drug initiation.

(5) FIG. 6 shows the response profile for percent reduction from baseline in 3-month average of monthly migraine days for the mITT population.

(6) FIG. 7 shows the percent of participants with a $\geq 50\%$ reduction in 3-month average monthly migraine days (MMDs) for placebo, atogepant 10 mg, atogepant 30 mg, and atogepant 60 mg. With respect to the proportion of patients who achieved a $\geq 50\%$ reduction in their 3-month average of monthly migraine days, all three atogepant doses had a significantly greater 50% responder rate versus placebo, with nearly double the proportion of responders achieving at least a 50% reduction in monthly migraine days across all doses when compared to placebo.

(7) FIG. 8A shows the proportion of participants achieving $\geq 25\%$, $\geq 50\%$, $\geq 75\%$, and 100% responder rates in the 12-week average of monthly migraine days. FIG. 8B shows a cumulative distribution function graph of the percent reduction from baseline in 12-week average MMDs.

(8) FIG. 8C shows the proportion of participants with $\geq 25\%$ reduction in mean monthly migraine

days, and FIG. 8D shows the proportion of participants with $\geq 50\%$, $\geq 75\%$, and 100% reduction in monthly migraine days for month 1 (weeks 1-4), month 2 (weeks 5-8), and month 3 (weeks 9-12) across the 12-week treatment period.

(9) FIG. 9A shows the mean change from baseline in moderate/severe headache days per month (mITT population). FIG. 9B shows the mean change from baseline in monthly headache days per month.

(10) FIG. 10A shows the LS mean change (SE) from baseline in mean monthly acute medication use days across the 12-week treatment period for atogepant 10 mg, atogepant 30 mg, atogepant 60 mg, and placebo. FIG. 10B shows the LS mean change from baseline in acute medication use days during the first treatment period (weeks 1-4), second treatment period (weeks 5-8) and third treatment period (weeks 9-12) for atogepant 10 mg, atogepant 30 mg, atogepant 60 mg, and placebo. FIG. 10C shows the LS mean reduction from baseline in mean cumulative headache hours during the first treatment period (weeks 1-4), second treatment period (weeks 5-8) and third treatment period (weeks 9-12) for atogepant 10 mg, atogepant 30 mg, atogepant 60 mg, and placebo.

(11) FIG. 11 shows the migraine-specific quality of life questionnaire role function-restrictive domain score for weeks 4, 8, and 12 for all three atogepant doses and placebo. Significant differences vs. placebo were observed at the earliest time point assessed (week 4) and seen throughout the treatment period. All atogepant groups achieved within-group minimally important difference among the MSQ v 2.1 domains at weeks 4, 8 and 12. BL, baseline mean; LSM, least squares mean; LSMD, least squares mean difference; MSQ, Migraine-Specific Quality of Life Questionnaire; QD, once daily; RFR, Role Function-Restrictive Domain; SE, standard error. a Role Function-Restrictive domain assesses how migraines limit one's daily social and work-related activities. Participants respond to items using a 6-point scale ranging from "none of the time" to "all of the time." Raw domain scores are rescaled to a 0 to 100 scale, where higher scores indicate better quality of life. *LSMD (95% CI): Week 4:8.6 (4.4, 12.9); $P<0.0001$; Week 8:11.3 (7.1, 15.5); $P<0.0001$; Week 12:9.9 (5.5, 14.4); $P<0.0001$; †LSMD (95% CI): Week 4:11.2 (7.0, 15.4); $P<0.0001$; Week 8:9.9 (5.8, 14.0); $P<0.0001$; Week 12:10.1 (5.7, 14.5); $P<0.0001$; ‡LSMD (95% CI): Week 4:12.3 (8.1, 16.5); $P<0.0001$; Week 8:10.8 (6.7, 14.9); $P<0.0001$; Week 12:10.8 (6.4, 15.2); $P<0.0001$.

(12) FIG. 12 provides a schematic for the design of the study evaluating the safety and tolerability of long-term atogepant treatment (Study B).

(13) FIG. 13 shows the LS mean change from baseline in number of migraine days over time (mITT population) in the 52-week long term safety study of atogepant. Administration of 60 mg atogepant led to a rapid reduction in monthly migraine days in month 1, with additional gradual improvement over time through week 52.

(14) FIG. 14 shows the LS mean change from baseline in monthly acute medication use days at each monthly period (mITT population) in the 52-week long-term safety study of atogepant. Administration of 60 mg atogepant led to a rapid reduction in monthly acute medication use days in month 1, with additional gradual improvement over time through week 52.

(15) FIG. 15A shows the results for $\geq 50\%$ improvement (reduction) in monthly migraine days at each monthly period (mITT population).

(16) FIG. 15B shows the proportion of responders with $\geq 50\%$, $\geq 75\%$, and $\geq 100\%$ reduction in monthly migraine days (MMDs) (mITT population, observed cases) in the 52-week, multicenter, open-label trial (Study B) of atogepant in adult patients with episodic migraine with or without aura.

(17) FIG. 16A shows the change from baseline in AIM-D monthly PDA domain score: reduced impairment in performance of daily activities (mITT population). FIG. 16B shows the change from baseline in AIM-D monthly PI domain score: reduced physical impairment (mITT population) over the 52-week, multicenter, open-label, 52-week, long-term safety trial (Study B) of atogepant in

adult patients with episodic migraine with or without aura.

(18) FIG. 17 shows the LS mean change from baseline in MSQ v 2.1-RFR Domain Score (mITT population, MMRM analysis) over the 52-week, multicenter, open-label trial (Study B) of atogepant in adult patients with episodic migraine with or without aura. Findings indicated rapid improvement over the first 12 weeks, and sustained improvement from 12 to 52 weeks. Non-zero confidence intervals throughout indicate significant improvement at each time point assessed.

(19) FIG. 18 shows the change from baseline in HIT-6 Total Score (mITT population).

(20) FIG. 19 shows CDF plots for percentage change from baseline in body weight (kg) at the end of the double-blind treatment period for Study A (safety population). Statistically significant weight loss was observed in the atogepant 30 mg once daily and 60 mg once daily groups compared with placebo.

(21) FIG. 20 shows CDF plots for percentage change from baseline in body weight (kg) at the end of the open-label treatment period for Study B (safety population). As shown in FIG. 20, treatment with atogepant over the 52-week treatment period was associated with weight loss.

(22) FIGS. 21-24 show CDF plots of weight loss for the safety population in the Study B long-term safety study. In particular, FIG. 21 is a CDF plot of weight loss for the safety population in the long-term safety study at 3 months; FIG. 22 is a CDF plot of weight loss for the safety population in the long-term safety study at 6 months; FIG. 23 is a CDF plot of weight loss for the safety population in the long-term safety study at 9 months; and FIG. 24 is a CDF plot of weight loss for the safety population in the long-term safety study at 12 months.

(23) FIG. 25 shows the percentage of patients reporting at least 75% reduction in migraine or probably migraine days after one month, two months or three months of treatment with placebo or 10 (QD), 30 (QD), 60 (QD), 30 (BID) or 60 (BID) doses of atogepant.

(24) FIG. 26 shows the percentage of patients reporting at 100% reduction in migraine or probably migraine after one month, two months or three months of treatment with placebo or 10 (QD), 30 (QD), 60 (QD), 30 (BID) or 60 (BID) doses of atogepant.

DETAILED DESCRIPTION

(25) The present disclosure provides methods for treating migraine in a patient in need thereof. In embodiments, the present disclosure provides methods for the prophylactic treatment of patients suffering from migraine. In embodiments, the present disclosure provides methods for the treatment of migraine comprising administering a prophylactically effective amount of atogepant or a pharmaceutically acceptable salt thereof. The structure of atogepant is shown below:

(26) ##STR00001##

(27) Atogepant is a small molecule CGRP receptor antagonist which may be administered orally, reaching maximum plasma concentrations by 2 hours, with a half-life of approximately 11 hours.

(28) Prophylactic treatment can reduce the frequency and intensity of migraine attacks. In embodiments, the prophylactic methods can result in freedom from symptoms associated with migraine attacks, including headaches. In embodiments, the administration of atogepant may provide for fewer symptoms or symptoms of reduced intensity. In embodiments, the non-headache symptoms of migraine may be reduced or eliminated. In embodiments, the prophylactic methods of the present disclosure are directed to the entire range of symptoms experienced by a patient during a migraine attack, and not solely at the prevention of headaches associated with a migraine attack.

(29) The indications for preventative treatment of migraine have been published by the American Academy of Neurology. See Update: Pharmacologic Treatment for Episodic Migraine Prevention in Adults, American Academy of Neurology, 2012. Prophylactic treatment is generally proposed for patients who suffer from two or more migraine attacks per month. Prophylactic treatment can also be used for patients who experience less frequent migraine attacks that are more potent or even disabling.

(30) In embodiments, a patient in need of treatment may suffer from one or more symptoms of migraine including, for example, sinusitis, nausea, nasopharyngitis, photophobia, appetite changes,

cognition and concentration difficulties, cold extremities, diarrhea or other bowel changes, excitement or irritability, fatigue, frequent urination, memory changes, weakness, yawning, stretching, seeing bright spots or flashes of light, vision loss, seeing dark spots, tingling sensations, speech problems, aphasia, tinnitus, gastric stasis, pulsating or throbbing pain on one or both sides of the head, extreme sensitivity to light, sounds, or smells, worsening pain during physical activity, and vomiting, abdominal pain or heartburn, loss of appetite, lightheadedness, blurred vision, and fainting. In embodiments, the administration of a prophylactically effective amount of atogepant results in the improvement, reduced frequency, or reduced intensity of symptoms.

(31) In embodiments, the present disclosure provides a method for the prophylactic treatment of migraine comprising regularly administering to a patient in need thereof a therapeutically effective amount of atogepant, or a pharmaceutically acceptable salt thereof. In embodiments, atogepant is administered orally at a dose of about 5 mg to about 500 mg once, twice, or three times a day. In embodiments, atogepant is administered orally at a once-daily dose of about 10 mg. In embodiments, atogepant is administered orally at a once-daily dose of about 30 mg. In embodiments, atogepant is administered orally at a once-daily dose of about 50 mg. In embodiments, atogepant is administered orally at a once-daily dose of about 100 mg. In embodiments, atogepant is administered orally at a dose of about 10 mg twice a day. In embodiments, atogepant is administered orally at a dose of about 30 mg twice a day. In embodiments, atogepant is administered orally at a dose of about 50 mg twice a day. In embodiments, atogepant is administered orally at a dose of about 100 mg twice a day.

(32) In embodiments, atogepant is administered orally at a once-daily dose of 10 mg. In embodiments, atogepant is administered orally at a once-daily dose of 10 mg for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks.

(33) In embodiments, atogepant is administered orally at a once-daily dose of 30 mg. In embodiments, atogepant is administered orally at a once-daily dose of 30 mg for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks.

(34) In embodiments, atogepant is administered orally at a once-daily dose of 60 mg. In embodiments, atogepant is administered orally at a once-daily dose of 60 mg for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks.

(35) In embodiments, atogepant can be administered orally, sublingually, transdermally, subcutaneously, intravenously, or intramuscularly.

(36) In embodiments, the prophylactic treatment with atogepant does not significantly affect the level of liver enzymes, in particular alanine aminotransferase (ALT) or aspartate aminotransferase (AST). For example, after treatment with atogepant for a period of about three months, the baseline pretreatment level of AST or ALT is not increased more than 50%, 75%, 100% or 200%. The baseline ALT levels can be measured as units per liter in the serum based on established methods. (Neuschwander-Tetri, B. A. et. al., Arch Intern Med. 2004 Mar. 24; 168 (6): 663-666; Kasarala, G. et. al., Clinical Liver Disease, 8, (1) July 2016) Neuschwander-Tetri states that the healthy ALT should be up to 30 units per liter of serum (U/L) for men, and 19 U/L for women. In embodiments, the prophylactic treatment with atogepant for a period of about three months does not elevate the ALT levels above the healthy levels of 30 U/L for men and 19 U/L for women. In embodiments, the application provides a method of treating migraine in patients with elevated ALT or AST levels. For example, migraine in patients with elevated ALT or AST levels (above 30 U/L for men and 19 U/L for women) can be treated with atogepant. In embodiments, the application provides a method for

treating migraine in patients with nonalcoholic steatohepatitis (NASH).

(37) In embodiments, the pretreatment baseline level of AST is about 5 to 40 units per liter of serum, and after treatment with atogepant for a period of about three months, the level of AST is less than about 100 or 90 or 75 or 60 or 50 units per liter of serum.

(38) In embodiments, the pretreatment baseline level of ALT and pretreatment baseline level of AST is about 7 to 56 units per liter of serum, and after treatment with atogepant for a period of about three months, the level of ALT is less than about 100 or 90 or 75 or 60 or 50 units per liter of serum.

(39) In embodiments, atogepant, or a pharmaceutically acceptable salt thereof, is administered to a patient identified as susceptible to treatment with atogepant or a pharmaceutically acceptable salt thereof. A patient that suffers from episodic migraine may be considered susceptible to treatment with atogepant (for example 10 mg QD, 30 mg QD, or 60 mg QD) if after a treatment period of one month, two months, or three months, the patient achieves at least 70% reduction in migraine or probable migraine days, or at least 75% reduction, at least 80% reduction, at least 85% reduction, at least 90% reduction, at least 95% reduction or 100% reduction in migraine or probable migraine days.

(40) In embodiments, atogepant or a pharmaceutically acceptable salt thereof, is administered to a patient suffering from episodic migraine for at least one month, or at least two months, or at least three months, and results in at least three fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 mean monthly migraine days, or at least 4 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days relative to no treatment.

(41) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 mean monthly migraine days, or at least 4 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days.

(42) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD to a population of human patients, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 mean monthly migraine days, or at least 4 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days. In embodiments, at least about 70% of the patients in the population of human patients have taken at least one prior preventive migraine therapy. In embodiments, the atogepant is administered for at least one month, or at least two months, or at least three months.

(43) For example, in embodiments, the present disclosure provides a method for prophylactically treating migraine, comprising administering atogepant in an amount of 10 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.65 fewer mean monthly migraine days, or at least 3.69 fewer mean monthly migraine days.

(44) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month

(such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 10 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, administering atogepant results in at least 3.4 fewer monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.65 fewer mean monthly migraine days, or at least 3.69 fewer mean monthly migraine days.

(45) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 10 mg QD to a population of human patients, resulting in a reduction in mean monthly migraine days. In embodiments, at least about 70% of the patients in the population have taken at least one prior preventive migraine therapy. In embodiments, administering atogepant results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.65 fewer mean monthly migraine days, or at least 3.69 fewer mean monthly migraine days.

(46) In embodiments, the present disclosure provides a method for prophylactically treating migraine, comprising administering atogepant in an amount of 30 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.86 fewer mean monthly migraine days.

(47) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 30 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.86 fewer mean monthly migraine days.

(48) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 30 mg QD to a population of human patients, resulting in a reduction in mean monthly migraine days. In embodiments, at least about 70% of the patients in the population have taken at least one prior migraine therapy. In embodiments, treatment results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.86 fewer mean monthly migraine days.

(49) In embodiments, the present disclosure provides a method for prophylactically treating migraine, comprising administering atogepant in an amount of 60 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, treatment results in at least 3.4 fewer monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.86 fewer mean monthly migraine days, or at least 3.9 fewer mean monthly migraine days, or at least 4.0 fewer mean monthly migraine days, or at least 4.1 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days.

(50) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 60 mg QD, resulting in a reduction in mean monthly migraine days. In embodiments, administering atogepant results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.9 fewer mean monthly migraine days, or at least 4.0 fewer mean monthly migraine days, or at least 4.1 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days.

(51) Treatment with atogepant can result in an early and sustained reduction in monthly migraine days. For example, treatment with atogepant can result in a treatment effect as early as the first full day after starting treatment with atogepant. In embodiments, the present disclosure provides a method of preventing migraine, such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering atogepant in an amount of 10 mg or 30 mg or 60 mg, wherein patients treated with atogepant are less likely to have a migraine on the day following atogepant administration than patients who received placebo.

(52) In embodiments, the present disclosure provides a method for preventing migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), wherein the method comprises administering atogepant in an amount of 60 mg QD to a population of human patients, resulting in a reduction in mean monthly migraine days. In embodiments, at least about 70% of the patients in the population have taken at least one prior migraine therapy. In embodiments, administering atogepant results in at least 3.4 fewer mean monthly migraine days, or at least 3.5 fewer mean monthly migraine days, or at least 3.6 fewer mean monthly migraine days, or at least 3.7 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.8 fewer mean monthly migraine days, or at least 3.9 fewer mean monthly migraine days, or at least 4.0 fewer mean monthly migraine days, or at least 4.1 fewer mean monthly migraine days, or at least 4.2 fewer mean monthly migraine days.

(53) In embodiments, the present disclosure provides a method for the prophylactic treatment of migraine comprising administering 10 mg atogepant or 30 mg atogepant or 60 mg atogepant to a patient in need thereof, wherein the patient achieves at least 50% reduction in 3-month average of monthly migraine days.

(54) In embodiments, the present disclosure provides a method for preventing migraine, such as a method of preventing migraine in a patient having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant or 30 mg atogepant or 60 mg atogepant, wherein the patient achieves at least 50% reduction in 3-month average of monthly migraine days.

(55) In embodiments, the present disclosure provides a method for the prophylactic treatment/prevention of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant or 30 mg atogepant or 60 mg atogepant to a population of patients, wherein at least about 50% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 55% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 58% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 60% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days. In embodiments, at least about 70% of the patients in the population of patients have taken at least one prior migraine therapy.

(56) In embodiments, the present disclosure provides a method for the prevention of migraine in

patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant to a population of patients, wherein at least about 50% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 55% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days.

(57) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least four weeks to a population of patients, wherein at least about 40%, or at least about 45%, or at least about 49% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least four weeks to a population of patients, wherein at least about 20% of patients, or at least about 25% of patients, or at least about 27% of patients, achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least four weeks to a population of patients, wherein at least about 7%, or at least about 10%, or at least about 12%, or at least about 14% of patients achieve 100% reduction in monthly migraine days.

(58) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 50%, or at least about 55%, or at least about 60% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 30%, or at least about 35%, or at least about 39% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 15%, or about 17%, or about 21% of patients achieve a 100% reduction in monthly migraine days.

(59) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 55%, or 60%, or 64% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 35%, or 40%, or 43% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 15%, or about 17%, or about 21% of patients achieve

a 100% reduction in monthly migraine days.

(60) In embodiments, the present disclosure provides a method for the prevention of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant to a population of patients, wherein at least about 50% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 55% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 58% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days.

(61) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 4 weeks to a population of patients, wherein at least about 40%, or about 45%, or about 48%, or about 49% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 4 weeks to a population of patients, wherein at least about 20%, or about 25%, or about 26%, or about 27% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least four weeks to a population of patients, wherein at least about 7%, or at least about 10%, or at least about 11% of patients achieve 100% reduction in monthly migraine days.

(62) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 50%, or at least about 55%, or at least about 60%, or at least about 61% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 30%, or at least about 35%, or at least about 36% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 15%, or about 17%, or about 18% of patients achieve a 100% reduction in monthly migraine days.

(63) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 50%, or 55%, or 60% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 35%, or 40%, or 43% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure

provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 15%, or about 20%, or about 25%, or about 27% of patients achieve a 100% reduction in monthly migraine days.

(64) In embodiments, the present disclosure provides a method for the prevention of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant to a population of patients, wherein at least about 50% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 55% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 58% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days, or at least about 60% of patients achieve $\geq 50\%$ reduction in a 3-month average of monthly migraine days.

(65) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 4 weeks to a population of patients, wherein at least about 50%, or about 55%, or about 60%, or about 61% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 4 weeks to a population of patients, wherein at least about 25%, or about 30%, or about 35%, or about 39% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least four weeks to a population of patients, wherein at least about 10%, or at least about 15%, or at least about 19% of patients achieve 100% reduction in monthly migraine days.

(66) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 50%, or at least about 55%, or at least about 60%, or at least about 65%, or at least about 66% of patients achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 30%, or at least about 35%, or at least about 40% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 8 weeks to a population of patients, wherein at least about 15%, or about 20%, or about 22%, or about 24% of patients achieve a 100% reduction in monthly migraine days.

(67) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 50%, or at least about 60%, or at least about 65%, or at least about 70%, or at least about 71% of patients

achieve $\geq 50\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 40%, or at least about 45%, or at least about 47%, or at least about 49% of patients achieve $\geq 75\%$ reduction in monthly migraine days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant for at least 12 weeks to a population of patients, wherein at least about 15%, or at least about 20%, or at least about 25%, or at least about 27% of patients achieve a 100% reduction in monthly migraine days.

(68) In embodiments, the present disclosure provides a method for prophylactically treating migraine in a patient in need thereof comprising administering atogepant in a therapeutically effective amount, resulting in fewer headache days per month. In embodiments, treatment results in a change from baseline of at least 3.8 fewer mean monthly headache days, or at least 3.9 fewer monthly mean monthly headache days, or at least 4 fewer monthly mean monthly headache days, or at least 4.1 fewer monthly mean monthly headache days, or at least 4.2 fewer mean monthly headache days.

(69) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD to a population of human patients, resulting in fewer headache days per month. In embodiments, at least about 70% of patients in the population have taken at least one prior migraine therapy. In embodiments, treatment results in a change from baseline of at least 3.8 fewer mean monthly headache days, or at least 3.9 fewer monthly mean monthly headache days, or at least 4 fewer monthly mean monthly headache days, or at least 4.1 fewer monthly mean monthly headache days, or at least 4.2 fewer mean monthly headache days.

(70) For example, in embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg QD to a population of human patients, resulting in fewer headache days per month. In embodiments, at least about 70% of patients in the population have taken at least one prior migraine therapy. In embodiments, administering atogepant results in a change from baseline of at least 3.8 fewer mean monthly headache days, or at least 3.9 fewer monthly mean monthly headache days.

(71) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen headache days per month), wherein atogepant is administered in an amount of 30 mg QD to a population of human patients, resulting in fewer headache days per month. In embodiments, at least about 70% of patients in the population have taken at least one prior migraine therapy. In embodiments, treatment results in a change from baseline of at least 3.8 fewer mean monthly headache days, or at least 3.9 fewer monthly mean monthly headache days, or at least 4 fewer monthly mean monthly headache days.

(72) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 30 mg QD to a population of human patients, resulting in fewer headache days per month. In embodiments, at least about 70% of patients in the population have taken at least one prior migraine therapy. In embodiments, treatment results in a change from baseline of at least 3.8 fewer mean monthly headache days, or at least 3.9 fewer monthly mean monthly headache days, or at least 4 fewer monthly mean monthly headache days, or at least 4.1 fewer monthly mean monthly headache days, or at least 4.2 fewer mean monthly

headache days.

(73) In embodiments, the present disclosure provides a method for prophylactically treating migraine in a patient in need thereof, the method comprising administering atogepant in an amount of 10 mg, 30 mg, or 60 mg, resulting in fewer acute medication use days per month. In embodiments, treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 3.5 days, or at least 3.6 days, or at least 3.66 days, or at least 3.68 days, or at least 3.7 days, or at least 3.8 days, or at least 3.85 days.

(74) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD to a population of human patients, resulting in fewer acute medication use days per month. In embodiments, at least about 70% of the patients in the population of human patients have taken at least one prior migraine therapy. In embodiments, treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 3.5 days, or at least 3.6 days, or at least 3.66 days, or at least 3.68 days, or at least 3.7 days, or at least 3.8 days, or at least 3.85 days.

(75) For example, in embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg QD. In embodiments, at least about 70% of the patients in the population of human patients have taken at least one prior migraine therapy. In embodiments, treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 3.5 days, or at least 3.6 days, or at least 3.66 days.

(76) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 30 mg QD. In embodiments, at least about 70% of the patients in the population of human patients have taken at least one prior migraine therapy. In embodiments, treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 3.5 days, or at least 3.6 days, or at least 3.66 days, or at least 3.68 days.

(77) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 60 mg QD. In embodiments, at least about 70% of the patients in the population of human patients have taken at least one prior migraine therapy. In embodiments, treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 3.5 days, or at least 3.6 days, or at least 3.66 days, or at least 3.68 days, or at least 3.7 days, or at least 3.8 days, or at least 3.85 days.

(78) In embodiments, the present disclosure provides methods for preventing or prophylactically treating migraine to result in improved patient function. In embodiments, the present disclosure provides methods for preventing migraine (such as a method of preventing migraine in patients having fewer than fifteen migraine days per month) by administering atogepant, resulting in an improvement in the physical impairment or quality-of-life impact scores reported by patients as compared to a pre-treatment baseline and/or a patient not receiving atogepant. Migraines can impact patient quality of life, impact productivity, and prevent patients from engaging in leisure and everyday activities. “Improved patient function” can be defined as an improvement measured by factors such as a reduced pain, reduced time spent in bed, increased ambulation, healthier attitude, more varied lifestyle and/or healing permitted by normal muscle tone. Improved patient function may be measured with an improved quality of life (QOL) or Health-Related Quality of Life (HRQL). These effects can be assessed, for example, using questionnaires or surveys, such as the Migraine-Specific Quality of Life Questionnaire (MSQ), the Headache Impact Test (“Headache Impact Test-6” or “HIT-6”), or the Activity Impairment in Migraine Diary (AIM-D). Scores obtained can be compared to published values available for various general and patient populations.

(79) The Migraine-Specific Quality of Life Questionnaire Version 2.1 is one of the most frequently

utilized disease-specific tools assessing the impact of migraine on HRQL. The MSQ is a validated tool that assess the impact of migraine on function (i.e., daily social and work-related activities) over the past 4 weeks across three dimensions: Role Function-Restrictive (RR, or “RFR”, relating to how migraines limit the patient's daily social and work related activities), Role Function-Preventive (RP, e.g., how migraines prevent the patient's daily social and work related activities), and Emotional Function (EF, e.g., the emotions associated with a patient's migraines). Patients respond to items using a 6-point scale: “none of the time,” “a little bit of the time,” “some of the time”, “a good bit of the time,” “most of the time” and “all of the time,” which are assigned scores of 1 to 6, respectively. Raw dimension scores are computed as a sum of item responses and rescaled from a 0 to 100 scale such that higher scores indicate better quality of life. See Bagley et al., *Validating Migraine-Specific Quality of Life Questionnaire v2.1 in Episodic and Chronic Migraine*, Headache, 2012 March; 52 (3): 409-21.

(80) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg, 30 mg, or 60 mg once daily, and wherein administration of atogepant results in improvements in the ability to perform daily activities. In embodiments, the improvement in the ability to perform daily activities is measured by the MSQ v2.1. In embodiments, treatment with atogepant results in a change from baseline in the MSQ v2.1 RFR Domain of greater than about 21.0 points, such as greater than about 25.0 points, or greater than about 30.0 points, or greater than about 30.1 points, or greater than about 30.2 points, or greater than about 30.3 points, or greater than about 30.4 points, or greater than about 30.5 points, or greater than about 31.0 points, or greater than about 31.3 points relative to baseline.

(81) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of about 10 mg QD, wherein the administration of atogepant results in an improvement in the ability to perform daily activities as measured by the MSQ v2.1. In embodiments, treatment with atogepant results in a change from baseline in the MSQ v2.1 RFR Domain of greater than about 25.0 points, or greater than about 30.0 points, or greater than about 30.1 points, or greater than about 30.2 points, or greater than about 30.3 points, or greater than about 30.4 points relative to baseline. For example, in embodiments, atogepant is administered in an amount of about 10 mg QD, and the ability to perform daily activities as measured by the MSQ v2.1 RFR Domain improves by about 30.4 points relative to baseline.

(82) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of about 30 mg QD, wherein administration of atogepant results in an improvement in the ability to perform daily activities as measured by the MSQ v2.1. In embodiments, treatment with atogepant results in a change from baseline in the MSQ v2.1 RFR Domain of greater than about 25.0 points, or greater than about 30.0 points, or greater than about 30.1 points, or greater than about 30.2 points, or greater than about 30.3 points, or greater than about 30.4 points, or greater than about 30.5 points relative to baseline. For example, in embodiments, atogepant is administered in an amount of about 30 mg QD, and the ability to perform daily activities as measured in the MSQ v2.1 RFR Domain improves by about 30.5 points relative to baseline.

(83) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of about 60 mg QD, wherein administration of atogepant results in an improvement in the

ability to perform daily activities as measured by the MSQ v2.1. In embodiments, treatment with atogepant results in a change from baseline in the MSQ v2.1 RFR Domain of greater than about 25.0 points, or greater than about 30.0 points, or greater than about 30.1 points, or greater than about 30.2 points, or greater than about 30.3 points, or greater than about 30.4 points, or greater than about 30.5 points, or greater than about 31.0 points, or greater than about 31.3 points relative to baseline. For example, in embodiments, atogepant is administered in an amount of about 60 mg QD, and the ability to perform daily activities as measured in the MSQ v2.1 RFR Domain improves by about 31.3 points relative to baseline.

(84) The Activity in Migraine Diary (AIM-D) evaluates the impact of migraine on the performance of daily activities and physical impairment using an electronic daily diary. In particular, the AIM-D is comprised of two domains that evaluate Performance of Daily Activities (PDA) and Physical Impairment (PI). Assessed items for the AIM-D PDA domain include household chores, errands, leisure activities at home, social or leisure activities outside the home, strenuous physical activities, concentration, and thinking clearly. Assessed items for the AIM-D PI Domain include walking, moving one's body, bending forward, and moving one's head. Response options for each item range from "not difficult at all" to "I could not do it at all" on a 6-point rating scale. The AIM-D domain scores are scaled from 0-100, with higher scores indicating greater impact of migraine, and reductions from baseline in scores indicate improvement. See Cala et al., The Activity Impairment in Migraine-Diary (AIM-D): A Novel Migraine-Specific Patient-Reported Outcome Measure to Assess Functioning Based on Activity Impairment in Episodic and Chronic Migraine Patients, MTIS2018-005 (Sep. 5, 2018).

(85) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in a patient having fewer than fifteen migraine days per month), wherein atogepant is administered in an amount of 10 mg, 30 mg, or 60 mg once daily, wherein administration of atogepant results in improvements in performance of daily activities and physical impairment. In embodiments, the improvement is assessed using a daily diary. In embodiments, the daily diary is the Activity Impairment in Migraine Diary (AIM-D). In embodiments, the daily activities include household chores, errands, leisure activities at home, social or leisure activities outside the home, strenuous physical activities, concentration, and thinking clearly. In embodiments, administration of atogepant results in less physical impairment in activities such as walking, moving the body, bending forward, and moving one's head.

(86) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, and reduces the patient's AIM-D Performance of Daily Activities score relative to baseline by more than about 6 points, or more than about 7 points, or more than about 7.5 points or more than about 8 points, or more than about 8.3 points, or more than about 8.6 points, or more than about 9 points, more than about 9.4 points. In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, and reduces the patient's AIM-D Physical Impairment score by more than about 4 points, or more than about 5 points, or more than about 5.5 points, or more than about 6 points, or more than about 6.5 points relative to baseline.

(87) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of about 30 mg QD, resulting in a reduction in the AIM-D Performance of Daily Activities score of more than about 7.5 points relative to baseline, such as more than about 7.7 points, or more than about 8 points, or more than about 8.2 points, or more than about 8.4 points, or more

than about 8.6 points relative to baseline. In embodiments, the reduction in the AIM-D PDA Score is about 8.6 points relative to baseline (i.e., -8.6 relative to baseline).

(88) In embodiments, the present disclosure provides a method for preventing migraine in a patient or a group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of about 60 mg QD, resulting in a reduction in the AIM-D Performance of Daily Activities Score of more than about 7.5 points relative to baseline, such as more than about 7.7 points, or more than about 8 points, or more than about 8.2 points, or more than about 8.4 points, or more than about 8.6 points, or more than about 8.8 points, or more than about 9 points, or more than about 9.2 points, or more than about 9.4 points relative to baseline. In embodiments, the reduction in the AIM-D PDA score is about 9.4 points relative to baseline (i.e., -9.4 relative to baseline).

(89) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of about 30 mg QD, resulting in a reduction in the AIM-D Physical Impairment Score of more than about 5.2 points relative to baseline, such as more than about 5.5 points, or more than about 5.7 points, or more than about 6.0 points relative to baseline. In embodiments, the reduction in the AIM-D PI score is about 6.0 points relative to baseline (i.e., -6.0 relative to baseline).

(90) In embodiments, the present disclosure provides a method for preventing migraine in a patient or group of patients (such as a method for preventing migraine in a patient or group of patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of about 60 mg QD, resulting in a reduction in the AIM-D Physical Impairment Score of more than about 5.2 points relative to baseline, such as more than about 5.5 points, or more than about 5.7 points, or more than about 6.0 points, or more than about 6.3 points, or more than about 6.5 points relative to baseline. In embodiments, the reduction in the AIM-D PI Score is about 6.5 points relative to baseline (i.e., -6.5 relative to baseline).

(91) In embodiments, the present disclosure provides a method for preventing migraine (such as a method for preventing migraine in patients having fewer than fifteen migraine days per month) wherein atogepant is administered in an amount of 10 mg QD, 30 mg QD, or 60 mg QD, wherein administration of atogepant results in a reduction in a 6-item Headache Impact Test (HIT-6) disability score relative to baseline. The Headache Impact Test (HIT-6) is a well-known tool for assessing migraine intensity, and uses six questions to measure the adverse impact of headache on, for example, social functioning, role functioning, vitality, cognitive functioning, and psychological distress. Responses are based on frequency using a 5-point verbal response scale ranging from “never” to “always”. The HIT-6 total score is the sum of the responses, and ranges from 36 to 78. See Yang et al., Validation of the Headache Impact Test (HIT-6™) Across Episodic and Chronic Migraine, *Cephalalgia* 2011 February; 31 (3): 357-367. In embodiments, treatment with atogepant results in a greater than five (≥ 5) point decrease in HIT-6 disability score.

(92) Long-Term Treatment with Atogepant

(93) In embodiments, atogepant may be administered daily for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks. Based on the clinical data, atogepant may be administered safely for at least up to 52 weeks.

(94) For example, in embodiments, atogepant may be administered at a dose of 10 mg QD, or 30 mg QD, or 60 mg QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks.

(95) For example, in an embodiment, atogepant may be administered in an amount of 60 mg once daily for at least 52 weeks. In embodiments, treatment with atogepant results in a reduction in mean

monthly migraine days of at least 3.8 days, or at least 4.1 days, or at least 4.3 days, or at least 4.6 days, or at least 4.7 days, or at least 4.8 days, or at least 4.9 days, or at least 5 days, or at least 5.1 days, or at least 5.19 days.

(96) In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering atogepant in an amount of 10 mg, 30 mg, or 60 mg for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks. For example, in embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having between 4-14 migraine days per month, the method comprising administering atogepant 60 mg QD for at least 52 weeks, wherein the treatment results in a reduction in mean monthly migraine days of at least 5 days, or at least 5.1 days, or at least 5.19 days.

(97) In embodiments, the present disclosure provides a method for the preventive treatment of migraine comprising administering 10 mg, 30 mg, or 60 mg atogepant for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein treatment results in a $\geq 50\%$ improvement (reduction) in monthly migraine days at each monthly period. In embodiments, at least 60% of patients achieve $\geq 50\%$ improvement (reduction) in monthly migraine days at each monthly period, or at least 70%, or at least 80%. In embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than fifteen migraine days per month, the method comprising administering atogepant 60 mg QD for at least 52 weeks, wherein treatment results in at least 50% improvement (reduction) in monthly migraine days at each monthly period.

(98) In embodiments, the present disclosure provides methods for the prevention of migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg, 30 mg, or 60 mg QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, resulting in fewer headache days per month. For example, in embodiments, the present disclosure provides a method for the preventive treatment of migraine in patients having fewer than 15 migraine days per month, the method comprising administering atogepant 60 mg QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein treatment with atogepant results in a reduction from baseline in monthly headache days of at least 4 days, or at least 5 days, or at least 5.3 days, or at least 5.6 days, or at least 5.9 days, or at least 5.99 days. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering atogepant 60 mg QD for at least 52 weeks, resulting in a reduction from baseline in monthly headache days of at least 5.9 days.

(99) In embodiments, the present disclosure provides methods for the prevention of migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 10 mg, 30 mg, or 60 mg QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, resulting in a reduction in mean monthly acute medication use days. For example, in embodiments,

the present disclosure provides methods for the preventive treatment of migraine in patients having fewer than 15 migraine days per month, the method comprising administering 60 mg atogepant QD for at least 4 weeks, or 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein treatment with atogepant results in a reduction in mean monthly acute medication use days of at least 4 days, or at least 4.4 days, or at least 4.5 days, or at least 4.6 days, or at least 4.7 days, or at least 4.9 days, or at least 4.93 days. In embodiments, the present disclosure provides methods for the preventive treatment of migraine, the method comprising administering atogepant 60 mg QD for at least 52 weeks, resulting in a change from baseline in acute monthly medication use days of about 4.93 days.

(100) Atogepant and Weight Loss

(101) Migraine and obesity are co-morbid conditions. Obesity has previously been linked both to an increased prevalence of migraine and also to increased migraine attack frequency leading to progression from episodic to chronic migraine. See Kristoffersen et al., *Migraine, Obesity, and Body Fat Distribution—a Population-Based Study*, *J. Headache & Pain* 21:97 (2020); Bigal M E, Liberman J N, Lipton R B (2006) Obesity and migraine: a population study. *Neurology*. 66 (4): 545-550; Bigal M E, Tsang A, Loder E, Serrano D, Reed M L, Lipton R B (2007) Body mass index and episodic headaches: a population-based study. *Arch Intern Med* 167 (18): 1964-1970; Peterlin B L, Rosso A L, Rapoport A M, Scher A I (2010) Obesity and migraine: the effect of age, gender and adipose tissue distribution. *Headache*. 50 (1): 52-62; Scher A I, Stewart W F, Ricci J A, Lipton R B (2003) Factors associated with the onset and remission of chronic daily headache in a population-based study. *Pain*. 106 (1-2): 81-89; Gelaye B, Sacco S, Brown W J, Nitchie H L, Ornello R, Peterlin B L (2017) Body composition status and the risk of migraine: a meta-analysis. *Neurology*. 88 (19): 1795-1804; Ornello R, Ripa P, Pistoia F, Degan D, Tiseo C, Carolei A et al (2015) Migraine and body mass index categories: a systematic review and meta-analysis of observational studies. *J Headache Pain*. 16:27; Winter A C, Berger K, Buring J E, Kurth T (2009) Body mass index, migraine, migraine frequency and migraine features in women. *Cephalalgia*. 29 (2): 269-278. Each of these references are incorporated by reference herein in their entireties.

(102) 40% of patients with migraine disease are obese (BMI ≥ 30 kg/m²). Further, migraine patients with BMI ≥ 27 kg/m² with obesity-related comorbidities (type 2 diabetes, hypertension, dyslipidemia, sleep apnea, cardiovascular disease). Treatment of obesity has been associated with both improved general health and improved migraine disease.

(103) It has been discovered that certain dosages of atogepant, when administered over a sufficient period of time, are associated with weight loss.

(104) Accordingly, in embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering atogepant to a patient in an amount effective to both prevent migraine and reduce the patient's body weight. For example, in embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering atogepant in an amount effective to reduce both the patient's monthly migraine days and the patient's body weight. In embodiments, the patient's body weight is reduced as compared to the patient's body weight before taking atogepant.

(105) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering atogepant daily to a patient for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein administration of atogepant results in a reduction in body weight by at least 0.5 kg, or at least 0.6 kg, or at least 0.7 kg, or at least 0.8 kg, or at least

0.9 kg, or at least 1 kg, or at least 1.1 kg, or at least 1.2 kg, or at least 1.3 kg, or at least 1.4 kg, or at least 1.42 kg. In embodiments, atogepant is administered daily in an amount of 10 mg, 30 mg, or 60 mg.

(106) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg or 60 mg atogepant QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, resulting in a reduction in body weight by at least 0.5 kg, or at least 0.6 kg, or at least 0.7 kg, or at least 0.8 kg, or at least 0.9 kg, or at least 1 kg, or at least 1.1 kg, or at least 1.2 kg, or at least 1.3 kg, or at least 1.4 kg, or at least 1.42 kg. Based on the clinical data, atogepant may be administered safely for at least up to 52 weeks.

(107) For example, in embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, resulting in a reduction in body weight by at least 0.5 kg, or at least 0.6 kg.

(108) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg atogepant QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein the mean difference for percentage change from baseline in body weight is at least about 0.7%, or at least about 0.8%, or at least about 0.9%, or at least about 0.98%. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 30 mg atogepant QD for at least about 12 weeks, wherein the mean difference for percentage change from baseline in body weight is about 0.98%. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 30 mg once daily for at least about 12 weeks, wherein treatment with atogepant results in at least about 3.2% of patients achieving a weight decrease of greater than about 7% from baseline.

(109) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, resulting in a reduction in body weight by at least about 0.5 kg, or at least about 0.6 kg, or at least about 0.7 kg, or at least about 0.8 kg, or at least about 0.9 kg, or at least about 1 kg, or at least about 1.1 kg, or at least about 1.2 kg, or at least about 1.27 kg. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg atogepant QD for at least 4 weeks, resulting in a reduction in body weight from baseline of at least about 0.6 kg, or at least about 0.7 kg, or at least

about 0.8 kg, or at least about 0.81 kg. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg atogepant QD for at least about 52 weeks, resulting in a reduction in body weight from baseline of at least about 1.1 kg, or at least about 1.2 kg, or at least about 1.3 kg, or at least about 1.4 kg, or at least about 1.42 kg.

(110) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant QD for at least 4 weeks, or at least 8 weeks, or at least 12 weeks, or at least 16 weeks, or at least 20 weeks, or at least 24 weeks, or at least 28 weeks, or at least 32 weeks, or at least 36 weeks, or at least 40 weeks, or at least 44 weeks, or at least 48 weeks, or at least 52 weeks, wherein the mean difference for percentage change from baseline in body weight is at least about 1.0%, or at least about 1.3%, or at least about 1.5%, or at least about 1.6%. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg atogepant QD for at least about 12 weeks, wherein the mean difference for percentage change from baseline in body weight is about 1.64%.

(111) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg QD atogepant for at least about 12 weeks, or at least about 16 weeks, or at least about 20 weeks, or at least about 24 weeks, or at least about 28 weeks, or at least about 32 weeks, or at least about 36 weeks, or at least about 40 weeks, or at least about 44 weeks, or at least about 48 weeks, or at least about 52 weeks to a population of patients, wherein at least about 10% of patients, or at least about 12% of patients, or at least about 14% of patients, achieve a weight decrease of greater than about 7% from baseline. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, such as a method for preventing migraine in patients having fewer than 15 migraine days per month (such as ≤ 14 migraine days per month, or between 4 and 14 migraine days per month), the method comprising administering 60 mg atogepant once daily for at least about 12 weeks, wherein treatment with atogepant results in at least about 4.9% of patients achieving a weight decrease of greater than about 7% from baseline. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about 6 months to a population of patients, wherein at least about 15% of patients, or at least about 18% of patients, or at least about 10% of patients, or at least about 22% of patients, achieve a weight decrease of greater than about 5% from baseline.

(112) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about six months to a population of patients, wherein at least about 8% of patients, or at least about 10% of patients, or at least about 12% of patients, achieve a weight decrease of greater than about 7% from baseline.

(113) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about 9 months to a population of patients, wherein at least about 15% of patients, or at least about 18% of patients, or at least about 10% of patients, or at least about 22% of patients, or at least about 25% of patients, achieve a weight decrease of greater than about 5% from baseline.

(114) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about nine months to a population of patients, wherein at least about 8% of patients, or at least about 10% of patients, or at least about 12% of patients, or at least about 14% of patients, achieve a weight decrease of greater than about 7% from baseline.

(115) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about 12 months to a population of patients, wherein at least about 18% of patients, or at least about 20% of patients, or at least about 22% of patients, or at least about 25% of patients, achieve a weight decrease of greater than about 5% relative to baseline. In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg atogepant QD for at least about 12 months, wherein at least about 22.4% of patients achieve a weight decrease of greater than about 5% relative to baseline body weight.

(116) In embodiments, the present disclosure provides a method for the preventive treatment of migraine, the method comprising administering 60 mg QD atogepant for at least about 12 months to a population of patients, wherein at least about 10% of patients, or at least about 12% of patients, or at least about 15% of patients, achieve a weight decrease of greater than about 7% from baseline.

(117) Definitions

(118) “About” or “approximately” means within an acceptable error range for the particular value as determined by one of ordinary skill in the art, which will depend in part on how the value is measured or determined, (i.e., the limitations of the measurement system). For example, “about” can mean within 1 or more than 1 standard deviations, per practice in the art. Where particular values are described in the application and claims, unless otherwise stated, the term “about” means within an acceptable error range for the particular value.

(119) “Administration” or “to administer” means the step of giving (i.e., administering) a pharmaceutical composition to a subject, or alternatively a subject receiving a pharmaceutical composition. The pharmaceutical compositions disclosed herein can be locally administered by various methods. For example, intramuscular, intradermal, subcutaneous administration, intrathecal administration, intraperitoneal administration, topical (transdermal), instillation, and implantation (for example, of a slow-release device such as polymeric implant or miniosmotic pump) can all be appropriate routes of administration.

(120) “Alleviating” means a reduction in the occurrence of a pain, of a headache, or of any symptom or cause of a condition or disorder. Thus, alleviating includes some reduction, significant reduction, near total reduction, and total reduction.

(121) Calcitonin-Gene-Related-Peptide, or “CGRP,” encompasses any member of the calcitonin family, including any calcitonin gene related peptide and analogs, calcitonin, amylin, adrenomedullin and their analogs.

(122) “CGRP antagonist” refers to any molecule that exhibits any one or more of the following characteristics: (a) bind to CGRP or CGRP-R and the binding results in a reduction or inhibition of CGRP activity; (b) block CGRP from binding to its receptor(s); (c) block or decrease CGRP receptor activation; (d) inhibit CGRP biological activity or downstream pathways mediated by CGRP signaling function; (e) increase clearance of CGRP; and (f) inhibit or reduce CGRP synthesis, production or release. CGRP antagonists include but are not limited to antibodies to CGRP, antibodies to the CGRP-R, small molecules that antagonize CGRP, and small molecules that antagonize CGRP-R.

(123) The term “prophylactic” or “preventative” refers to the prevention of the onset, recurrence or spread of a disease or disorder, or of one or more symptoms associated with the disease or disorder. In one embodiment, such symptoms are those known to a person of skill in the art to be associated with the disease or disorder being prevented. In certain embodiments, the terms refer to the treatment with or administration of a compound provided herein, with or without other additional active compound, prior to the onset of symptoms, particularly to patients at risk of disease or disorders provided herein. The terms encompass the inhibition or reduction of a symptom of the particular disease. For frequent migraines, prophylactic or preventative treatments are employed to reduce the frequency of migraines and also to reduce the severity and duration of migraines and their associated symptoms when they occur.

(124) A “prophylactically effective amount” of a compound is an amount sufficient to prevent a disease or disorder, or prevent its recurrence. A prophylactically effective amount of a compound means an amount of therapeutic agent that can provide a prophylactic or preventative benefit in the prevention of the disease. The term “prophylactically effective amount” can encompass an amount that improves overall prophylaxis or prevention or enhances the prophylactic or preventative efficacy of another prophylactic agent.

(125) “Effective amount” as applied to the biologically active ingredient means that amount of the ingredient which is generally sufficient to effect a desired change in the subject. For example, where the desired effect is a reduction in an autoimmune disorder symptom, an effective amount of the ingredient is that amount which causes at least a substantial reduction of the autoimmune disorder symptom, and without resulting in significant toxicity.

(126) “Headache day” refers to any calendar day on which headache pain lasting two hours or longer occurs unless an acute headache medication (e.g., ibuprofen, triptan) was used after the start of the headache, in which case no minimum duration is specified.

(127) “Intramuscular” or “intramuscularly” means into or within (as in administration or injection of a CGRP antagonist into) a muscle.

(128) “Local administration” means direct administration of a pharmaceutical at or to the vicinity of a site on or within an animal body, at which site a biological effect of the pharmaceutical is desired, such as via, for example, intramuscular or intra- or subdermal injection or topical administration. Local administration excludes systemic routes of administration, such as intravenous or oral administration. Topical administration is a type of local administration in which a pharmaceutical agent is applied to a patient's skin.

(129) “Migraine day” refers to any calendar day on which a headache occurs which meets criteria A, B, and C, or meets criteria D and E, as provided herein: (A) Headache has at least two of the following four characteristics: (i) unilateral location, (ii) pulsating quality, (iii) moderate or severe pain intensity, (iv) aggravated by or causing avoidance of routine physical activity (e.g., walking or climbing stairs) (B) At least one of the following: (i) Nausea and/or vomiting; (ii) Photophobia and phonophobia; (iii) Typical aura (i.e., visual, sensory, or speech/language) accompanying or within sixty minutes before headache begins (C) Duration of headache lasting two hours or longer on a calendar day unless an acute, migraine-specific medication (i.e., triptan or ergot derivative) was used after the start of the headache, in which case no minimum duration is specified OR (D) Any headache which fulfills one criterion from (1) and at least one criterion from (2) OR fulfills at least two criteria from (1) and no criteria from (2): (1) Headache characteristics: (i) Unilateral location; (ii) Pulsating quality; (iii) Moderate or severe pain intensity; (iv) Aggravated by or causing avoidance of routine physical activity (e.g., walking or climbing stairs) (2) Symptoms (i) Nausea and/or vomiting; (ii) Photophobia and phonophobia; (iii) Typical aura (i.e., visual, sensory, or speech/language) accompanying or within sixty minutes before headache begins. (E) Duration of headache lasting two hours or longer on a calendar day unless an acute, migraine-specific medication (i.e., triptan or ergot derivative) was used after the start of the headache, in which case no minimum duration is specified.

(130) “Patient” means a human or non-human subject receiving or in need of medical or veterinary care. Accordingly, the compositions as disclosed herein can be used in treating any animal, such as, for example, mammals, or the like.

(131) “Peripherally administering” or “peripheral administration” means subdermal, intradermal, transdermal, or subcutaneous administration, but excludes intramuscular administration.

“Peripheral” means in a subdermal location, and excludes visceral sites.

(132) “Pharmaceutical composition” means a composition comprising an active pharmaceutical ingredient, such as, for example, a CGRP antagonist, and at least one additional ingredient, such as, for example, a stabilizer or excipient or the like. A pharmaceutical composition is therefore a formulation which is suitable for diagnostic or therapeutic administration to a subject, such as a

human patient. The pharmaceutical composition can be, for example, in a lyophilized or vacuum dried condition, a solution formed after reconstitution of the lyophilized or vacuum dried pharmaceutical composition, or as a solution or solid which does not require reconstitution.

(133) “Pharmacologically acceptable excipient” is synonymous with “pharmacological excipient” or “excipient” and refers to any excipient that has substantially no long term or permanent detrimental effect when administered to mammal and encompasses compounds such as, e.g., stabilizing agent, a bulking agent, a cryo-protectant, a lyo-protectant, an additive, a vehicle, a carrier, a diluent, or an auxiliary. An excipient generally is mixed with an active ingredient, or permitted to dilute or enclose the active ingredient and can be a solid, semi-solid, or liquid agent. Non-limiting examples of pharmacologically acceptable excipients can be found in, e.g., *Pharmaceutical Dosage Forms and Drug Delivery Systems* (Howard C. Ansel et al., eds., Lippincott Williams & Wilkins Publishers, 7^{sup}.th ed. 1999); *Remington: The Science and Practice of Pharmacy* (Alfonso R. Gennaro ed., Lippincott, Williams & Wilkins, 20th ed. 2000); *Goodman & Gilman's The Pharmacological Basis of Therapeutics* (Joel G. Hardman et al., eds., McGraw-Hill Professional, 10^{sup}.th ed. 2001); and *Handbook of Pharmaceutical Excipients* (Raymond C. Rowe et al., APhA Publications, 4^{sup}.th edition 2003), each of which is hereby incorporated by reference in its entirety.

(134) The constituent ingredients of a pharmaceutical composition can be included in a single composition (that is, all the constituent ingredients, except for any required reconstitution fluid, are present at the time of initial compounding of the pharmaceutical composition) or as a two-component system, for example a vacuum-dried composition reconstituted with a reconstitution vehicle which can, for example, contain an ingredient not present in the initial compounding of the pharmaceutical composition. A two-component system can provide several benefits, including that of allowing incorporation of ingredients which are not sufficiently compatible for long-term shelf storage with the first component of the two-component system. A pharmaceutical composition can also include preservative agents such as benzyl alcohol, benzoic acid, phenol, parabens and sorbic acid. Pharmaceutical compositions can include, for example, excipients, such as surface active agents; dispersing agents; inert diluents; granulating and disintegrating agents; binding agents; lubricating agents; preservatives; physiologically degradable compositions such as gelatin; aqueous vehicles and solvents; oily vehicles and solvents; suspending agents; dispersing or wetting agents; emulsifying agents, demulcents; buffers; salts; thickening agents; fillers; antioxidants; stabilizing agents; and pharmaceutically acceptable polymeric or hydrophobic materials and other ingredients known in the art and described, for example in Genaro, ed., 1985, *Remington's Pharmaceutical Sciences*, Mack Publishing Co., Easton, Pa., which is incorporated herein by reference.

(135) “Polysaccharide” means a polymer of more than two saccharide molecule monomers. The monomers can be identical or different.

(136) “Stabilizers” can include excipients, and can include protein and non-protein molecules.

(137) “Therapeutic formulation” means a formulation can be used to treat and thereby alleviate a disorder or a disease, such as, for example, a disorder or a disease characterized by hyperactivity (i.e. spasticity) of a peripheral muscle.

(138) “Tonicity agent” means a low molecular weight excipient which is included in a formulation to provide isotonicity. Disaccharide, such as trehalose or sucrose, polyalcohol, such as sorbitol or mannitol, monosaccharide, such as glucose, and salt, such as sodium chloride, can serve as a tonicity agent.

(139) “Treating” means to alleviate (or to eliminate) at least one symptom of a condition or disorder, such as, for example, sinusitis, nausea, nasopharyngitis, photophobia, appetite changes, cognition and concentration difficulties, cold extremities, diarrhea or other bowel changes, excitement or irritability, fatigue, frequent urination, memory changes, weakness, yawning, stretching, seeing bright spots or flashes of light, vision loss, seeing dark spots, tingling sensations, speech problems, aphasia, tinnitus, gastric stasis, pulsating or throbbing pain on one or both sides

of the head, extreme sensitivity to light, sounds, or smells, worsening pain during physical activity, and vomiting, abdominal pain or heartburn, loss of appetite, lightheadedness, blurred vision or fainting or the like, either temporarily or permanently.

(140) The invention of the present disclosure will be more clearly understood by reference to the following examples, which are included for purposes of illustration only and are not intended to be limiting.

Example 1

(141) Study A: A phase 3, multicenter, randomized, double-blind, placebo-controlled, parallel-group study was conducted to evaluate the efficacy, safety, and tolerability of oral atogepant for the prevention of migraine in participants with episodic migraine (EM).

(142) This study comprised a 4-week screening and baseline period, a 12-week double-blind treatment period, and a 4-week follow-up period. The total study duration was 20 weeks.

(143) Adults 18 to 80 years of age with 4 to 14 migraine days per month in the 3 months prior to visit 1, and 4 to 14 migraine days during the 28-day baseline period per electronic Diary, were allowed to enroll. Inclusion criteria included at least a 1-year history of migraine with or without aura consistent with a diagnosis, diagnosed as specified in the International Classification of Headache Disorders, 3rd edition, version (ICHD-3), and the age of the participant at the time of migraine onset was <50 years. Exclusion criteria included a history of migraine accompanied by diplopia or decreased level of consciousness or retinal migraine; a current diagnosis of chronic migraine, new persistent daily headache, trigeminal autonomic cephalgia (e.g., cluster headache), or painful cranial neuropathy as defined by ICHD-3, or if they averaged 15 or more migraine days per month across the 3 months prior to Visit 1 or during the 28-day baseline period; a history of an inadequate response to >4 medications (2 of which have different mechanisms of action) prescribed for the treatment of migraine; and participants with clinically significant hematologic, endocrine, cardiovascular, pulmonary, renal, hepatic, gastrointestinal, or neurologic disease. Use of opioids or barbiturate on more than 2 days per month, triptans or ergots on 10 or more days per month, or simple analgesics (e.g., aspirin, non-steroidal anti-inflammatory drugs, acetaminophen) on 15 or more days per month in the 3 months prior to Visit 1 or during the 28-day baseline period were also excluded. Use of barbiturates was also excluded 30 days prior to screening and throughout the duration of the trial.

(144) Randomization was stratified based on prior exposure (yes/no) to a migraine prevention medication with proven efficacy, such as antiepileptics, tricyclic antidepressants, beta-blockers, calcium channel blocker, angiotensin receptor blocker or converting enzyme inhibitor, or serotonin-norepinephrine reuptake inhibitors. Approximately 70% of randomized participants took at least one prior migraine prevention medication with proven efficacy. Participants were not on concurrent medication during the study.

(145) The trial included 910 randomized participants (223 to placebo, 222 to atogepant 10 mg, 230 to atogepant 30 mg, and 235 to atogepant 60 mg). The safety population included 902 participants and the modified-intent-to-treat population (efficacy analysis population) included 873 participants; >87% of participants (805/910, 88.5%) completed the double-blind treatment period across all treatment groups. Baseline demographics and clinical characteristics were similar across treatment groups in the safety population. Participants were between 18 and 73 years of age, with a mean age of 41.6 years. 89% of participants were female, and 83% white, with a baseline BMI of 30.6 kg/m². At screening, 99.3% of participants reported use of medication for the acute treatment of migraine and 70.3% reported having previously used a preventive treatment for migraine, with or without proven efficacy. The baseline demographics of the safety population (i.e., all participants who received at least one dose of study intervention) are summarized in Table 1.

(146) TABLE-US-00001 TABLE 1 Baseline Demographics (Safety Population*) Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD Total Baseline Demographics (N = 222) (N = 221) (N = 228) (N = 231) (N = 902) Age Mean (SD) 40.3 (12.81) 41.4 (12.05) 42.1

(147) A total of 910 patients were randomized 1:1:1:1 to one of the four treatment groups (10 mg QD, 30 mg QD, 60 mg QD, or placebo). Efficacy analyses were based on the Modified Intent-to-Treat Population (mITT) of 873 patients. The Modified Intent-to-Treat (mITT) Population includes all randomized participants who received at least one dose of study intervention, had an evaluable baseline period of eDiary data, and had at least one evaluable post-baseline 4-week period (Weeks 1 to 4, 5 to 8, and 9 to 12) of eDiary data during the double-blind treatment period.

(148) All participants were instructed to take trial treatment orally at approximately the same time once daily for 12 weeks. To maintain the blinding, all participants took 3 tablets of trial treatment provided in identical blister cards: placebo (placebo 10 mg/placebo 30 mg/placebo 60 mg), atogepant 10 mg (atogepant 10 mg/placebo 30 mg/placebo 60 mg), atogepant 30 mg (placebo 10 mg, atogepant 30 mg, placebo 60 mg), and atogepant 60 mg (placebo 10 mg/placebo 30 mg/atogepant 60 mg). Participants, site personnel, and trial sponsor personnel were blinded to the treatment assignment. Tablet formulations for CGRP compounds are described, for example, in U.S. Pat. No. 10,117,936.

(149) Participants were allowed to take acute treatments for migraine which included triptans, ergot derivatives, opioids, acetaminophen, non-steroidal anti-inflammatory drugs, and antiemetic agents. Participants were not allowed to take any preventive treatments for migraine 30 days prior to visit 1 and throughout the trial.

(150) Efficacy assessments were recorded by the participant in an electronic diary at home or via eTablet at the trial site during clinic visits. Headache duration, headache clinical features (headache pain severity, unilateral location, aggravated by or causing avoidance of routine physical activity), non-headache associated symptoms (nausea and/or vomiting; photophobia, phonophobia, and aura), and acute medication use were recorded. Additional health outcomes measures were collected.

(151) The primary efficacy endpoint was change from baseline in mean monthly migraine days across the 12-week treatment period. Secondary efficacy endpoints, tested in hierarchical order, were change from baseline in mean monthly headache days across the 12-week treatment period, change from baseline in mean monthly acute medication use days across the 12 week treatment period, $\geq 50\%$ reduction in 3-month average of monthly migraine days, change from baseline in MSQ v 2.1 Role Function-Restrictive domain score at week 12, change from baseline in mean monthly Performance of Daily Activities domain score of the AIM-D across the 12-week treatment period, and change from baseline in mean monthly Physical Impairment domain score of the AIM-D across the 12-week treatment period. An exploratory analysis of the time course of efficacy for atogepant by 4-week intervals, based on the least square mean change from baseline for the number of monthly migraine days over the 12-week treatment period was also conducted.

(152) The primary efficacy variable was the change from baseline in mean monthly migraine days across the 12-week treatment period. The results are shown in Table 2. FIGS. 1 and 2 show the least square mean (\pm standard error of the least squares (SE)) of change from baseline in monthly migraine days (MMRM-mixed effects model for repeated measures) during the double-blind treatment period for the mITT population. FIG. 3 shows the distribution of change from baseline in monthly migraine days across 12 weeks by treatment group.

(153) TABLE-US-00002 TABLE 2 Primary Endpoint-Change from Baseline in Mean Monthly Migraine Days Across the 12-Week Treatment Period (mITT Population) Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Baseline number 7.51 (2.39) 7.45 (2.46) 7.86 (2.32) 7.75 (2.31) of monthly migraine days, mean (SD) LS Mean -2.48 (0.21) -3.69 (0.21) -3.86 (0.21) -4.20 (0.21) Change (SE) LSMD vs. — -1.21 (-1.78, -0.64) -1.38 (-1.94, -0.82) -1.72 (-2.28, -1.15) Placebo (95% CI) Nominal p-value — <.0001 <.0001 <.0001 Adjusted p-value — <.0001 <.0001 <.0001 SD = Standard Deviation; LS = Least Squares; SE = Standard error of the least squares; CI = Confidence Interval; LSMD = least squares mean difference.

(154) As shown in Table 2 and FIGS. 1, 2, and 3, all atogepant dose groups met the primary endpoint and demonstrated statistically significantly greater decreases in monthly migraine days compared to placebo. Patients treated in the 10 mg, 30 mg, and 60 mg atogepant arms experienced a decrease of 3.69, 3.86, and 4.20 days, respectively, all compared to patients in the placebo arm, who experienced a decrease of 2.48 days (all dose groups vs. placebo, $p < 0.0001$).

(155) The LS mean change from baseline in monthly migraine days across 12 weeks by treatment group is shown in FIG. 4. FIG. 5A shows the mean change from baseline in weekly migraine days during the first month (weeks 1-4) by treatment group. During weeks 1-4 of treatment, mean change from baseline in mean monthly migraine days was -3.1 for atogepant 10 mg, -3.4 for atogepant 30 mg, -3.9 for atogepant 60 mg, and -1.6 for placebo. This significantly greater decrease in monthly migraine days was maintained during the subsequent two 4-week intervals of double-blind treatment for all atogepant doses (weeks 5-8: -3.7 for atogepant 10 mg, -3.9 for atogepant 30 mg, -4.2 for atogepant 60 mg, and -2.9 for placebo, $P < 0.012$ for all atogepant groups; weeks 9-12: -4.2 for atogepant 10 mg, -4.3 for atogepant 30 mg, -4.4 for atogepant 60 mg, and -3.0 for placebo, $P < 0.0002$ for all atogepant groups).

(156) During the 28-day baseline period, the mean weekly migraine days were 1.9 in the overall mITT population. Mean change from baseline in weekly migraine days during the first week of treatment was -0.77 atogepant 10 mg, -0.94 atogepant 30 mg, -1.03 atogepant 60 mg, and -0.29 placebo ($P < 0.0001$ all dose groups). The greater reduction in weekly migraine days compared with placebo was consistent throughout each week of the first 4-week interval of treatment ($P < 0.0397$ all dose groups). On the first full day after study drug administration, the proportion of participants who reported a migraine day was 14.1% for atogepant 10 mg, 10.8% for atogepant 30 mg, and 12.3% for atogepant 60 mg versus 25.2% in the placebo group ($P \leq 0.0071$ all dose groups). The proportions of participants with a migraine each day during the first week of treatment (mITT population) are shown in FIG. 5B. On post dose days 2-6, the proportions of participants reporting a migraine was consistently lower across the treatment groups compared with placebo, with the majority of days reaching significance vs. placebo ($P < 0.05$) in the atogepant 30 mg and 60 mg dose groups. The odds ratio vs placebo for reporting a migraine on post dose day 1 was 0.49 with atogepant 10 mg, 0.33 with atogepant 30 mg, and 0.39 with atogepant 60 mg. Atogepant provided an early and sustained reduction in migraine days including statistically significant reductions in each of the three 4-week intervals, each week during the first 4-week interval, and as early as the first full day after study drug initiation.

(157) A secondary endpoint measured the proportion of patients that achieved a 50% reduction in mean monthly migraine days across the 12-week treatment period. The results are shown in Table 3. The response profile for percent reduction from baseline in 3-month average of monthly

migraine days (mITT population) is set forth in FIGS. 6 and 7. In particular, FIG. 6 shows the response profile for percent reduction from baseline in 3-month average of monthly migraine days for the mITT population. FIG. 7 shows the percent of participants with a $\geq 50\%$ reduction in 3-month average monthly migraine days.

(158) TABLE-US-00003 TABLE 3 $\geq 50\%$ Reduction in 3-Month Average of Monthly Migraine Days (mITT Population) Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Responder, n (%) 62 (29.0) 119 (55.6) 131 (58.7) 135 (60.8) Odds ratio vs. Placebo — 3.06 (2.05, 4.56) 3.53 (2.37, 5.26) 3.82 (2.56, 5.71) (95% CI) Nominal p-value — $<.0001$ $<.0001$ $<.0001$ Adjusted p-value — $<.0001$ $<.0001$ $<.0001$ CI = confidence interval

(159) As shown in Table 3, 55.6%, 58.7%, and 60.8% of patients in the 10 mg, 30 mg, and 60 mg atogepant arms, respectively, achieved at least a 50% reduction in mean monthly migraine days across the 12-week treatment period, compared to 29% of patients in the placebo arm (all dose groups vs. placebo, $p < 0.0001$).

(160) Prespecified additional endpoints included proportions of participants achieving $\geq 25\%$, $\geq 75\%$, and 100% reductions in the 12-week average of MMDs. A 100% reduction in MMDs represented individuals reporting no migraine days from the day the participant received the first dose of study treatment (day 1) through the end of week 12. The results are shown in Tables 4-6. FIG. 8A illustrates the proportion of participants achieving various responder rates by treatment group across the 12-week treatment period.

(161) TABLE-US-00004 TABLE 4 $\geq 25\%$ Reduction in 3-Month Average of Monthly Migraine Days Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Responder, n (%) 126 (58.9) 157 (73.4) 172 (77.1) 180 (81.1) $P < .0018$ for all comparisons

(162) TABLE-US-00005 TABLE 5 $\geq 75\%$ Reduction in 3-Month Average of Monthly Migraine Days Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Responder, n (%) 23 (10.7) 65 (30.4) 66 (29.6) 84 (37.8) $P < .0001$ for all comparisons

(163) TABLE-US-00006 TABLE 6 100% Reduction in 3-Month Average of Monthly Migraine Days Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Responder, n (%) 2 (0.9) 17 (7.9) 11 (4.0) 17 (7.7) $P < .0207$ for all comparisons

(164) Atogepant-treated participants were significantly more likely to experience a $\geq 50\%$ reduction in mean MMDs across 12 weeks (range 56%-61% vs 29% with placebo, $P < 0.0001$). Atogepant treated patients were also significantly more likely than placebo-treated participants to experience $\geq 25\%$ (range 73%-81% vs 59% for placebo, $P < 0.01$), $\geq 75\%$ (range 30%-38% vs 11% for placebo, $P < 0.0001$), and 100% (range 5%-8%, vs 1% for placebo, $P < 0.05$) reductions in MMDs across 12 weeks.

(165) FIG. 8B provides a cumulative distribution function graph of the percent reduction from baseline in 12-week average MMDs. As shown in FIG. 8B, response rates were better for each of the three atogepant groups vs. placebo. A consistently higher proportion of participants in each of the three atogepant groups showed improvement in 12-week average MMDs compared with placebo across all levels of improvement that were evaluated.

(166) Additional prespecified exploratory endpoints included $\geq 25\%$, $\geq 50\%$, $\geq 75\%$, and 100% reductions in MMDs by 4-week intervals (weeks 1-4, 5-8, 9-12). FIG. 8C shows the proportion of participants with $\geq 25\%$ reduction in mean monthly migraine days, and 8D shows the proportion of participants with $\geq 50\%$, $\geq 75\%$, and 100% reduction in monthly migraine days across the 12-week treatment period, for month 1 (weeks 1-4), month 2 (weeks 5-8) and month 3 (weeks 9-12). Response to atogepant treatment was evident as early as the first four weeks of treatment and increased over time. All differences for $\geq 50\%$, $\geq 75\%$, and 100% responder rates by 4-week

intervals were statistically significant in favor of atogepant. For $\geq 25\%$ responder rates, all differences were statistically significant in favor of atogepant vs placebo, except for atogepant 10 mg for weeks 5-8.

(167) Relative to placebo, atogepant treated participants were ≥ 3 times more likely to achieve $\geq 50\%$ reduction in the 12-week average of MMDs. At all doses, atogepant was effective in the first 4 weeks for $\geq 25\%$, $\geq 50\%$, $\geq 75\%$, and 100% responders, suggesting robust treatment effects in the first month. The proportion of participants experiencing a $\geq 25\%$, $\geq 50\%$, $\geq 75\%$, and 100% reduction in mean MMDs significantly increased with duration of treatment for all atogepant doses and efficacy was sustained for three months, noting that placebo response rates also increased throughout the study period. The responder rates were higher with increasing doses among the atogepant treatment groups.

(168) A secondary endpoint measured the change from baseline in mean monthly headache days across the 12-week treatment period. The results are shown in Table 7.

(169) TABLE-US-00007 TABLE 7 Change from Baseline in Mean Monthly Headache Days across the 12-Week Treatment Period (mITT Population) Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Baseline number of mean 8.43 (2.55) 8.41 (2.75) 8.78 (2.62) 9.00 (2.56) monthly headache days, mean (SD) LS Mean Change (SE) -2.52 (0.23) -3.94 (0.22) -4.04 (0.22) -4.23 (0.22) LSMD vs. Placebo — -1.42 (-2.03, -0.81) -1.53 (-2.13, -0.92) -1.71 (-2.32, -1.10) (95% CI) Nominal p-value — <.0001 <.0001 <.0001 Adjusted p-value — <.0001 <.0001 <.0001 SD = Standard Deviation; LS = Least Squares; SE = Standard error of the least squares; CI = Confidence Interval; LSMD = least squares mean difference.

(170) As shown in Table 7, patients in the 10 mg, 30 mg, and 60 mg atogepant arms experienced a decrease of 3.94, 4.04, and 4.23 days, respectively, all compared to patients in the placebo arm, who experienced a decrease of 2.52 days (all dose groups vs. placebo, $p < 0.0001$).

(171) The mean change from baseline in moderate/severe headache days per month (mITT population) is shown in FIG. 9A, and the mean change from baseline in monthly headache days per month (mITT population) is shown in FIG. 9B. The LS mean change from baseline in moderate/severe headache days in the first treatment period (weeks 1-4) was -3.0 for atogepant 10 mg, -3.2 for atogepant 30 mg, -3.8 for atogepant 60 mg, and -1.7 for placebo ($P < 0.0001$ for all atogepant groups). The LS mean change from baseline in mean headache days in the first treatment period was -3.2 for atogepant 10 mg, -3.4 for atogepant 30 mg, -3.8 for atogepant 60 mg, and -1.4 for placebo ($P < 0.0001$ for all atogepant groups).

(172) A secondary endpoint measured change from baseline in mean monthly acute medication use days across the 12-week treatment period. The results are shown in Table 8 and FIG. 10A.

(173) TABLE-US-00008 TABLE 8 Change from Baseline in Mean Monthly Acute Medication Use Days Across the 12-Week Treatment Period (mITT Population) Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Baseline number of 6.48 (3.15) 6.57 (2.99) 6.69 (3.02) 6.89 (3.17) monthly acute medication use days, mean (SD) LS Mean Change (SE) -2.35 (0.18) -3.66 (0.18) -3.68 (0.18) -3.85 (0.18) LSMD vs. Placebo — -1.31 (-1.81, -0.82) -1.33 (-1.82, -0.83) -1.50 (-2.00, -1.01) (95% CI) Nominal p-value — <.0001 <.0001 <.0001 Adjusted p-value — <.0001 <.0001 <.0001 SD = Standard Deviation; LS = Least Squares; SE = Standard error of the least squares; CI = Confidence Interval; LSMD = least squares mean difference.

(174) As shown in Table 8 and FIG. 10A, patients in the 10 mg, 30 mg, and 60 mg atogepant arms experienced a decrease of 3.66, 3.68, and 3.85 days, respectively, across the 12-week treatment period compared to patients in the placebo arm, who experienced a decrease of 2.35 days (all dose groups vs. placebo, $p < 0.0001$).

(175) The LS mean change from baseline in acute medication use days during the first treatment period (weeks 1-4) was -3.3 for atogepant 10 mg, -3.4 for atogepant 30 mg, -3.7 for atogepant 60

mg, and -1.7 for placebo ($P < 0.0001$ for all atogepant groups). The LS mean change in acute medication use days showed a nominally significant difference from placebo starting in the first treatment period and persisting into the second and third treatment periods, as shown in FIG. 10B. Baseline mean cumulative headache hours ranged from 47.4-51.1 in the mITT population. The LS mean reduction from baseline in mean cumulative headache hours during the first treatment period was -23.3 for atogepant 10 mg, -23.6 for atogepant 30 mg, -25.1 for atogepant 60 mg, and -9.5 for placebo ($P < 0.0001$ for all atogepant groups). LS mean reduction from baseline in mean cumulative headache hours is illustrated in FIG. 10C.

(176) TABLE-US-00009 TABLE 9 Baseline Parameters on Efficacy Measures (mITT Population)

| Baseline Parameters | Atogepant 10 mg QD | Atogepant 30 mg QD | Atogepant 60 mg QD | Placebo |
|--------------------------------------|--------------------|--------------------|--------------------|-------------|
| mean (SD) (N = 214) | 51.1 (34.5) | 47.4 (27.3) | 49.5 (26.7) | 50.4 (27.4) |
| Cumulative Headache Hours Monthly | 6.5 (2.6) | 6.4 (2.6) | 6.9 (2.5) | 6.9 (2.6) |
| Moderate/Severe Headache days Weekly | 1.9 (0.6) | 1.9 (0.6) | 2.0 (0.6) | 1.9 (0.6) |

migraine days* *For weekly data, baseline was defined as monthly migraine days divided by 4, and change from baseline in weekly migraine days was calculated for consecutive 7-day periods beginning with day 1.

(177) A secondary endpoint measured the change from baseline in MSQ v2.1 Role Function Restrictive Domain Score at Week 12. The Migraine-Specific Quality of Life Questionnaire Version 2.1 is one of the most frequently utilized disease-specific tools assessing the impact of migraine on HRQL. The MSQ measures the impact of migraine on the patient's HRQL over the past 4 weeks across three dimensions: Role Function-Restrictive (RR), Role Function-Preventive (RP), and Emotional Function (EF). The results from this secondary endpoint analysis are shown in Table 10.

(178) TABLE-US-00010 TABLE 10 Change from Baseline in MSQ v2.1 Role Function Restrictive Domain* Score at Week 12 (mITT Population)

| Atogepant | Atogepant | Atogepant | Placebo |

SD = Standard Deviation; LS = Least Squares; SE = Standard error of the least squares; CI = Confidence Interval; LSMD = least squares mean difference. *Role Function-Restrictive domain assesses how migraines limit one's daily social and work-related activities. Participants respond to items using a 6-point scale ranging from “none of the time” to “all of the time.” Raw domain scores are rescaled to a 0 to 100 scale, where higher scores indicate better quality of life. Items included leisure time activities; work or daily activities; getting done as much at work or home; concentrate on work or daily activities; left you too tired; dealt with family, friends, and others; felt energetic. **The MMRM model includes baseline as a covariate, prior exposure to migraine prevention medications (y/n), treatment group, and visit (month) as fixed factors, and treatment group by visit and baseline-by-visit as interaction terms, with an unstructured covariance matrix. P values are from the test between the atogepant dose group and placebo.

(179) As shown in Table 10, at week 12, statistically significant and clinically meaningful improvements for all dose groups vs placebo were observed in the RFR domain (10 mg, 9.9 [5.5-14.4]; 30 mg, 10.1 [5.7-14.5]; 60 mg, 10.8 [6.4-15.2]), in the RFP domain (10 mg, 5.8 [1.9-5.6]; 30 mg, 6.9 [3.1-10.7], 60 mg, 7.1 [3.3-10.9]), and in the EF domain (10 mg, 8.3 [3.4-13.1]; 30 mg, 9.7 [4.9-14.4]; 60 mg, 10.5 [5.8-15.3]). FIG. 11 illustrates the Migraine-Specific Quality of Life Questionnaire Role Function-Restrictive Domain Score at Weeks 4, 8, and 12. As shown in FIG. 11, for the RFR domain, significant differences vs. placebo were observed at the earliest time point assessed (week 4) and seen throughout the treatment period.

(180) In people with 4-14 migraine days per month, oral atogepant produced significant and

clinically meaningful between- and within-group reductions in emotional impact, improvements in functioning in daily social and work-related activities, the ability to undertake daily activities that had previously been prevented by migraine, and reduction in the emotional effect of migraine, as measured by the MSQ v 2.1. These results indicate that preventive treatment with atogepant is associated with statistically significant and clinically meaningful improvements in all domains of migraine-specific quality of life.

(181) A secondary endpoint evaluated the change from baseline in mean monthly performance of daily activities domain score of the AIM-D across the 12-week treatment period. Another secondary endpoint evaluated the change from baseline in mean monthly physical impairment domain score of the AIM-D across the 12-week treatment period. The Activity Impairment in Migraine-Diary (AIM-D) is an 11-item daily diary that is comprised of two domains that evaluate Performance of Daily Activities (PDA; 7 items) and Physical Impairment (PI; 4 items). See Cala et al., “The Activity Impairment in Migraine Diary (AIM-D): A novel migraine-specific patient-reported outcome measure to assess functioning based on activity impairment in episodic and chronic migraine patients”, *Cephalalgia* 2018; 38:1-115, which is incorporated by reference herein in its entirety. In particular, the AIM-D assesses the impact of migraine on the performance of daily activities and physical impairment using a 6-point rating scale ranging from “Not difficult at all,” “A little difficult,” “Somewhat difficult,” “Very Difficult,” “Extremely Difficult”, and “I could not do it at all.” Items assessed for the AIM-D PDA domain included household chores, errands, leisure activities at home, social or leisure activities outside the home, strenuous physical activities, concentration, and thinking clearly. Items assessed for the AIM-D PI Domain included walking, moving body, bending forward, and moving head. Raw domain scores are recalled to a 0 to 100 scale, where higher scores indicate greater impact of migraine, and reductions from baseline in scores indicate improvement. The AIM-D was collected daily via an electronic diary with the same set of questions administered in headache (HA) and non-headache (NHA) versions. Monthly domain scores are calculated by summing the non-missing daily domain scores (HA and NHA days combined) and dividing the number of non-missing daily scores. The secondary endpoints for AIM-D PDA and PI domain scores were evaluated as change from baseline in mean monthly PDA or PI domain scores of the AIM-D across the 12-week treatment period. The results with respect to daily activity are shown in Table 11. The results with respect to change from baseline in mean monthly physical impairment domain score are shown in Table 12.

(183) TABLE-US-00012 TABLE 12 Change from Baseline in Mean Monthly Physical Impairment Domain*** Score of the AIM-D Across the 12-Week Treatment Period (mITT population)

Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 214) (N = 214) (N = 223) (N = 222) Baseline monthly physical impairment domain score, mean (SD) 11.2 (8.11) 11.7 (8.46) 13.0 (8.00) 11.6 (7.85) LS Mean Change (SE) -4.03 (0.44) -5.11 (0.44) -6.02 (0.44) -6.49 (0.44) LSMD vs. Placebo — -1.08 (-2.27, 0.11) -1.99 (-3.18, -0.80) -2.46 (-3.65, -1.28) (95% CI) Nominal p-value — 0.0743 0.0011 <.0001 Adjusted p-value — 0.0856 0.0021 0.0002 SD = Standard Deviation; LS = Least Squares; SE = Standard error of the least squares; CI = Confidence Interval; LSMD = least squares mean difference. ***Items included walking, moving body, bending forward, and moving head.

(184) As shown in Tables 11 and 12, compared with placebo, all atogepant groups demonstrated improvement of function in PDA and PI domain scores across the 12-week treatment period. For both AIM-D domains, differences were statistically significant for participants in the atogepant 60 mg and 30 mg groups (least squares mean difference [LSMD] vs placebo: PDA, -3.32 for 60 mg, -2.54 for 30 mg; PI, -2.46 for 60 mg, -1.99 for 30 mg). The improvement in PDA and PI domain scores for the atogepant 10 mg group did not reach statistical significance vs. placebo (LSMD: -1.19 and -1.08, respectively).

(185) As shown above, with respect to the secondary endpoints, treatment with 30 mg and 60 mg atogepant doses resulted in statistically significant improvements in all secondary endpoints, and treatment with 10 mg atogepant resulted in statistically significant improvements in four out of the six secondary endpoints. Atogepant demonstrated significant improvements in patients' functioning in daily activities, and reductions in physical impairment and the impact of headaches, confirming its role as a promising treatment among people with migraine.

(186) The Headache Impact Test (HIT-6, completed monthly) represented an additional exploratory measure. The HIT-6 test is a well-known tool for assessing migraine intensity that uses six questions to capture the impact of headache and its treatment on an individual's functional health and well-being. HIT-6 was completed monthly and was evaluated as the change from baseline in HIT-6 total score at weeks 4, 8, and 12. HIT-6 results are shown in Table 13.

(187) TABLE-US-00013 TABLE 13 HIT-6: Change from Baseline to Week 12 Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD mITT Population (N = 214) (N = 214) (N = 223) (N = 222) Change from baseline to n = 178 n = 182 n = 181 n = 178 week 12 Baseline, mean (SD) 64.5 (4.5) 64.1 (5.4) 64.3 (4.9) 63.6 (5.6) Week 12, mean (SD) 59.2 (6.5) 55.8 (8.3) 56.1 (8.6) 54.5 (9.0) Change from baseline, -5.3 (6.8) -8.3 (7.8) -8.1 (7.9) -9.9 (8.7) mean (SD) MMRM.sup.b, LS mean -5.2 (0.5) -8.4 (0.5) -8.1 (0.5) -9.2 (0.5) change (SE) LSMD vs placebo -3.2 (-4.7, -1.7) -2.9 (-4.3, -1.4) -4.0 (-5.4, -2.5) (95% CI) P value <0.0001 0.0001 <0.0001 Responders.sup.c, n/N (%) Week 4 127/206 (38.3) 101/208 (48.6) 102/219 (46.8) 122/217 (56.2) Odds ratio vs. Placebo 1.53 (1.03, 2.27) 1.43 (0.97, 2.12) 2.18 (1.47, 3.25) (95% CI) P value 0.0386 0.738 0.0001 Week 8 96/203 (47.3) 113/187 (60.4) 130/209 (62.2) 134/207 (64.7) Odds ratio vs. Placebo 1.79 (1.19, 2.68) 1.95 (1.31, 2.90) 2.25 (1.50, 3.37) (95% CI) P value 0.0053 0.0011 <0.0001 Week 12 103/198 (52.0) 120/186 (64.5) 128/204 (62.7) 131/201 (65.2) Odds ratio vs. Placebo 1.74 (1.15, 2.62) 1.54 (1.03, 2.30) 1.77 (1.18, 2.66) (95% CI) P value 0.0086 0.0334 0.0055 HIT-6, 6-item headache impact test; LSMD, least squares mean difference; mITT, modified intent to treat; MMRM, mixed-effects model for repeated measures change from baseline; QD, once daily; SD, standard deviation; SE, standard error of the least squares. .sup.bThe MMRM model includes baseline as a covariate, prior exposure to migraine prevention medications (y/n), treatment group, and visit (month) as fixed factors, and treatment group by visit and baseline-by-visit as interaction terms, with an unstructured covariance matrix. P values are from the test between the atogepant dose group and placebo. .sup.cResponders defined as patients experiencing

a ≥ 5 point reduction in the HIT-6 score.

(188) All atogepant groups demonstrated significant improvement in HIT-6 scores vs. placebo at weeks 4, 8, and 12. Significantly greater proportions of atogepant vs. placebo-treated participants were HIT-6 responders (≥ 5 point decrease) with all atogepant doses (except 30 mg at week 4).

(189) The AIM-D and HIT-6 results demonstrate that atogepant significantly improved patient functioning in daily activities, and reduced physical impairment and impact of headaches.

(190) Additional prespecified responder analyses included the Patient Global Impression of Change (PGI-C), defined as “much better” or “very much better” at week 12, and satisfaction with study medication, defined as “satisfied” or “extremely satisfied” at weeks 4, 8, and 12. The results are shown in Table 14.

(191) TABLE-US-00014 TABLE 14 PGI-C and Treatment Satisfaction After 12 Weeks of Treatment (mITT Population) Responder Criteria, Placebo Atogepant 10 mg Atogepant 30 mg Atogepant 60 mg Week 12 (n = 214) (n = 214) (n = 223) (n = 222) PGI-C,^a n/N 95/206 145/201 153/209 162/213 Percentage 46.1% 72.1% 73.2% 76.1% OR (95% CI) — 3.05 (2.01, 4.61) 3.33 (2.20, 5.05) 3.83 (2.52, 5.84) P value <0.0001 <0.0001 <0.0001 Satisfaction with 109/199 146/188 162/203 166/201 Study Medication.^b Percentage 54.8% 77.7% 80.3% 82.6% OR (95% CI) — 2.77 (1.81, 4.24) 3.44 (2.23, 5.30) 3.58 (2.31, 5.54) P value <0.0001 <0.0001 <0.0001

.sup.aResponse defined as “much better” or “very much better” bResponse defined as “satisfied” or “extremely satisfied”. OR, odds ratio; PGI-C, Patient Global Impression of Change.

(192) Significantly higher proportions of patients receiving atogepant were responders at week 12 for PGI-C (72%-76%) and were satisfied with treatment (78%-83%) vs placebo (46% and 55%, $P < 0.0001$), as shown in Table 14. The odds of achieving PGI-C response in each atogepant group was ≥ 3 times that of placebo. A greater proportion of participants in each of the three atogepant arms met treatment satisfaction responder criteria at weeks 4, 8, and 12, compared with placebo, as shown in Table 14. The odds for being treatment satisfaction responders at week 12 for atogepant were approximately 2-4 times greater than placebo.

(193) Participants treated with atogepant were more satisfied with treatment and reported greater improvement in their migraine attacks compared with placebo. Even if a participant did not achieve the thresholds for being considered a treatment responder, a high proportion of participants (70-80%) reported feeling “much better” or “very much better”, demonstrating that some individuals experience a treatment benefit without exceeding specified responder definitions.

(194) The study further showed that atogepant was safe and well-tolerated. Adverse events were reported by participants throughout the trial, and at a 4-week follow-up visit. Adverse event information was collected and documented during each clinic visit. Participants could also report adverse events via telephone call between visits. Causality of each adverse event was determined by the investigator who was blinded to the treatment. In addition, clinical laboratory tests, vital signs, electrocardiograms (ECG), and Columbia-Suicide Severity Rating Scale were evaluated. Based on the potential hepatotoxicity of prior gepants, treatment-emergent elevations in ALT or AST ≥ 3 times the upper limit of normal, as well as potential Hy's law cases, were evaluated as prespecified adverse events of special interest and were reviewed by an independent panel of liver experts blinded to treatment (see, e.g., Negro A et al., CGRP Receptor Antagonists: an expanding drug class for acute migraine? Expert Opin Investig Drugs 2012; 21:807-18; Messina R et al., CGRP—a target for acute therapy in migraine: Clinical Data. Cephalalgia 2019; 39:420-7).

(195) Rates of adverse events (AEs) were similar across all treatment groups. Treatment-emergent adverse events were reported in 53.9% of participants (486 of 902 participants); the frequency of events was similar between placebo and atogepant treatment groups and no dose relationship was observed. Serious adverse events occurred in 0.9% of patients treated in the atogepant 10 mg arm compared to 0.9% of patients in the placebo arm (2 participants in both the placebo and atogepant 10 mg groups). In particular, serious adverse events were reported in 2 participants treated with placebo (gastric ulcer hemorrhage; post-surgical laryngospasm with hypoxic brain injury) and 2

participants treated with atogepant 10 mg (asthma attack; optic neuritis). The asthma attack was considered unrelated to trial treatment and clinical evidence did not support the diagnosis of optic neuritis.

(196) No patients in the atogepant 30 mg or 60 mg treatment arms experienced a serious adverse event. The most common adverse events reported with a frequency of $\geq 5\%$ in at least one atogepant treatment arm, and greater than placebo, were constipation (6.9-7.7% across all doses vs. 0.5% for placebo), nausea (4.4-6.1% across all doses vs. 1.8% for placebo), and upper respiratory tract infection (3.9-5.7% across all doses vs. 4.5% for placebo). The majority of cases of constipation, nausea and upper respiratory tract infection were mild or moderate in severity and did not lead to discontinuation. Cases of constipation were primarily mild (71.4%) or moderate (26.5%) in severity. One case of constipation was considered severe in the atogepant 10 mg group. This was reported as a worsening of pre-existing constipation and the participant was treated with over-the-counter medication, completed the trial, and entered an open-label extension study. All reported cases of nausea were mild (77.1%) or moderate (22.9%) in severity.

(197) Rates of discontinuation due to AEs were low across all treatment groups and not dose-dependent. Rates of discontinuation for the highest doses were the same or lower than placebo. The rates of adverse events are summarized in Table 15:

(198) TABLE-US-00015 TABLE 15 Adverse Events Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 222) (N = 221) (N = 228) (N = 231) n (%) n (%) n (%) n (%)

(199) Safety population included all randomized participants who took at least 1 dose of trial treatment. Participants are only counted once within each category. Percentages are calculated at $100 \times (n/N)$, where n is the number of participants within a specific category and N is the number of participants in the safety population for the treatment group. Adverse events are listed in decreasing order based on frequency reported in the overall population.

(200) There were no hepatic safety issues identified in this trial. ALT and/or AST increases were low across all atogepant doses and occurred at a lower rate than placebo. Cases of ALT or AST elevations that were $\geq 3 \times$ upper limit of normal (ULN) occurred at a lower rate compared to placebo (where 4 cases were reported), and did not increase with an increase in dose. No cases of liver disease were reported, and no case met the criteria for potential Hy's Law following daily dosing for 12 weeks. Tables 16 and 17 summarize postbaseline hepatic laboratory parameter values.

(201) TABLE-US-00016 TABLE 16 Postbaseline Hepatic Laboratory Parameter Values of Clinical Interest - Safety Population Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 222) (N = 221) (N = 228) (N = 231) Parameter Criterion n/N1 n/N1 n/N1 n/N1 ALT or AST (U/L) $\geq 1 \times$ ULN 35/220 (15.9) 19/220 (8.6) 18/225 (8.0) 28/228 (12.3) $\geq 1.5 \times$ ULN 14/220 (6.4) 3/220 (1.4) 7/225 (3.1) 7/228 (3.1) $\geq 2 \times$ ULN 6/220 (2.7) 2/220 (0.9) 2/225 (0.9) 4/228 (1.8) $\geq 3 \times$ ULN 4/220 (1.8) 2/220 (0.9) 2/225 (0.9) 1/228 (0.4) $\geq 5 \times$ ULN 1/220 (0.5) 1/220 (0.5)

(202) TABLE-US-00017 TABLE 17 Hepatic Safety Summary Atogepant Atogepant Atogepant Placebo 10 mg QD 30 mg QD 60 mg QD (N = 222) (N = 221) (N = 228) (N = 231) ALT or AST (U/L), n/N1 (%) $\geq 3 \times$ upper limit of 4/220 (1.8) 2/220 (0.9) 2/225 (0.9) 1/228 (0.4) normal (ULN) Potential Hy's Law ALT or AST $\geq 3 \times 0/0/0/0$ ULN AND Bilirubin Total $\geq 2 \times \text{ULN}$ AND ALP $< 2 \times \text{ULN}$ N1 = number of participants with at least one non-missing postbaseline value n = number of participants within a specific category.

(203) In summary, as shown above, atogepant 10 mg, 30 mg, and 60 mg groups demonstrated statistically significant and clinically meaningful improvements over the placebo group for the primary efficacy endpoint (reduction in mean monthly migraine days). There was a clinically relevant dose response relationship. Significant improvements were also observed for all secondary endpoints, with atogepant 30 mg and 60 mg meeting all six secondary endpoints, and atogepant 10 mg meeting four secondary endpoints. Atogepant 10 mg, 30 mg, and 60 mg groups demonstrated statistically significant and clinically meaningful improvements over the placebo group in the proportion of patients with 50% reduction in mean monthly migraine days (56-61% reduction in monthly migraine days vs. 29% for placebo).

(204) Atogepant was safe and well-tolerated. The most common TEAEs were constipation (~7%) and nausea (~5%). No hepatic safety issues were identified.

Example 2

(205) Study B: A phase 3, multicenter, randomized, open label study was conducted to evaluate the long-term safety and tolerability of oral atogepant for the prevention of migraine in participants with episodic migraine (Study B). The study objective was to evaluate the safety and tolerability of daily treatment with atogepant 60 mg QD when administered over 52 weeks for the prevention of migraine in participants with episodic migraine.

(206) FIG. 12 provides a schematic for the long-term safety study design. The study comprised a 4-week baseline/screening period, followed by a 52-week open-label treatment period, and a 4-week safety follow-up period.

(207) A total of 744 participants from 106 sites were randomized in a ratio of 5:2 to the following treatment groups: atogepant 60 mg QD or oral standard of care (SOC) migraine prevention medication. The latter arm was included to contextualize safety data from the atogepant-treated participants, and efficacy measures were collected from the atogepant arm only. Efficacy measures were evaluated using the modified intent-to-treat (mITT) population and a mixed-effects model for repeated measures and included changes from baseline in monthly migraine days (MDDs), moderate/severe headache days, and acute medication use days, as well as the proportion of responders based on reductions in MMDs.

(208) A total of 739 patients (n=546 atogepant) were included in the safety population. Participants included: (1) eligible participants who completed study NCT02848326 (visit 8) without significant protocol deviations (e.g., non-compliance with protocol-required procedures) and who did not experience an AE that, in the investigator's opinion, may indicate an unacceptable safety risk; and (2) de novo participants-adults (18-80 years) with a history (≥ 1 year) of migraine and 4-14 migraine days per month.

(209) For participants in the SOC group, participants who did not tolerate the initially prescribed migraine preventive medication, or for whom the medication was not sufficiently effective (per investigator judgment), the investigator was allowed to prescribe an alternative medication or not prescribe any migraine preventive medication. Regardless of which of these options was chosen, the participant was allowed to continue in the study. In addition, the investigator had the option to select alternative preventive medication, or discontinue migraine prevention medication, for a

participant in the SOC migraine preventive medication arm as often as needed throughout the study.

(210) Table 18 provides a summary of the subject population.

(211) TABLE-US-00018 TABLE 18 Subject Population Population Standard of Care Atogepant 60 mg QD Overall Screened, N — — 1727 Intent-to-Treat, N 198 546 744 De Novo, N 170 467 637 CGP-MD-01 28 79 107 Completers, N Safety, N 196 543 739 Modified — 521 521 Intent-to-Treat, N

(212) All Screened Participants include those screened participants that signed informed consent forms. The Intent-to-Treat Population (ITT) includes all of the randomized participants. The safety population includes all participants who received at least one dose of study intervention (atogepant or SOC medication). The modified intent-to-treat population (mITT) includes all randomized participants who received at least one dose of atogepant, had an evaluable baseline period of eDiary data, and had at least one evaluable post-baseline 4-week period of eDiary data.

(213) Table 19 provides a summary of patient disposition during the open-label treatment period for all randomized participants.

(214) TABLE-US-00019 TABLE 19 Participant Disposition During Open-Label Treatment Period - All Randomized Participants Standard Atogepant of Care 60 mg QD Overall (N = 198) (N = 546) (N = 744) Disposition n (%) n (%) n (%) Number of Participants 198 (100.0) 546 (100.0) 74 (100.0) Entered Number of Participants 136 (68.7) 373 (68.3) 509 (68.4) Completed Number of Participants 62 (31.3) 173 (31.7) 235 (31.5) Discontinued Reason for Discontinuation Adverse events 5 5 (2.5) 31 (5.7) 36 (4.8) Lack of Efficacy 2 2 (1.0) 5 (0.9) 7 (0.9) Withdrawal by Subject 29 29 (14.6) 75 (13.7) 104 (14.0) Lost to Follow-Up 16 16 (8.1) 23 (4.2) 39 (5.2) Pregnancy 2 2 (1.0) 4 (0.7) 6 (0.8) Protocol Deviation 7 7 (3.5) 31 (5.7) 38 (5.1) Non-compliance with 1 1 (0.5) 3 (0.5) 4 (0.5) study drug Other 0 0 (0.0) 1 (0.2) 1 (0.1)

(219) Adverse events were reported by 67.0% of participants treated with atogepant; 18.0% of participants reported AEs that were considered related to atogepant by the investigator. Most commonly reported AEs (≥5% of participants) were upper respiratory tract infection (10.3%),

constipation (7.2%), nausea (6.3%), and urinary tract infection (5.2%) following treatment with atogepant. Serious AEs were reported by 4.4% of participants treated with atogepant, which included a broad variety of common medical conditions; no event was seen in more than one participant and no event was considered related to atogepant. Two deaths were reported in participants treated with atogepant (victim of homicide and a group A beta-hemolytic streptococcal sepsis [toxic shock syndrome]); both were considered not related to atogepant. Discontinuation due to AEs was 5.7% following treatment with atogepant. Table 23 summarizes the adverse events in the safety population.

(223) Efficacy endpoints for this study included change from baseline in monthly migraine days at each monthly period; change from baseline in monthly headache days at each monthly period; change from baseline in monthly acute medication use days at each monthly period; and $\geq 50\%$ improvement (reduction) in monthly migraine days at each monthly period.

(224) LS mean change from baseline in monthly migraine days over time (mITT population) is shown in FIG. 13. As shown in FIG. 13, atogepant 60 mg led to a reduction from baseline in monthly migraine days of approximately 4 days in month 1, followed by additional improvement over time for the remaining months. That is, a rapid reduction in monthly migraine days was observed in month 1, with additional gradual improvement over time through week 52. The change from baseline in monthly migraine days over time (mITT population) is shown in Table 25.

(228) FIG. 14 shows the LS mean change from baseline in monthly acute medication use days at each monthly period (mITT population), which is also summarized in Table 27.

(229) TABLE-US-00027 TABLE 27 Change from Baseline in Monthly Acute Medication Use Days At Each Monthly Period (mITT Population) Atogepant 60 mg QD (N = 521) Change from Baseline Observed Mean LS means (95% CI) - Derived Visit N (SD) MMRM Baseline 521 6.59 (3.27) — Weeks 1-4 513 2.60 (3.00) -4.04 (-4.28, -3.81) Weeks 5-8 490 2.49 (3.06) -4.11 (-4.37, -3.86) Weeks 9-12 466 2.39 (2.90) -4.18 (-4.42, -3.94) Weeks 13-16 440 2.09 (2.58) -4.46 (-4.68, -4.23) Weeks 17-20 419 1.92 (2.68) -4.56 (-4.80, -4.33) Weeks 21-24 417 2.01 (2.65) -4.49 (-4.72, -4.25) Weeks 25-28 398 1.90 (2.78) -4.59 (-4.84, -4.34) Weeks 29-32 390 1.84 (2.64) -4.54 (-4.79, -4.28) Weeks 33-36 379 1.75 (2.54) -4.66 (-4.90, -4.41) Weeks 37-40 375 1.75 (2.52) -4.68 (-4.93, -4.44) Weeks 41-44 363 1.69 (2.62) -4.71 (-4.97, -4.46) Weeks 45-48 352 1.51 (2.46) -4.90 (-5.15, -4.66) Weeks 49-52 335 1.50 (2.73) -4.93 (-5.20, -4.66)

(230) FIG. 15A shows the results for $\geq 50\%$ improvement (reduction) in monthly migraine days at each monthly period (mITT population) which is also summarized in Table 28.

(231) TABLE-US-00028 TABLE 28 $\geq 50\%$ Improvement (reduction) in monthly migraine days at each monthly period (mITT population) Atogepant 60 mg QD (N = 521) Derived Visit Responder n/N1 (%) Weeks 1-4 310/513 (60.4) Weeks 5-8 319/490 (65.1) Weeks 9-12 327/466 (70.2) Weeks 13-16 326/440 (74.1) Weeks 17-20 308/419 (73.5) Weeks 21-24 314/417 (75.3) Weeks 25-28 299/398 (75.1) Weeks 29-32 299/390 (76.7) Weeks 33-36 305/379 (80.5) Weeks 37-40 293/375 (78.1) Weeks 41-44 285/363 (78.5) Weeks 45-48 290/352 (82.4) Weeks 49-52 282/335 (84.2)

(232) The proportion of responders with $\geq 50\%$, $\geq 75\%$, and 100% reduction in MMDs (mITT population, observed cases), are shown in FIG. 15B. Of participants who remained in the trial at weeks 49-52, 84.2% (282/335) experienced $\geq 50\%$ reduction in MMDs, 69.9% (234/335) experienced $\geq 75\%$ reduction in MMDs, and 48.4% (162/335) experienced a 100% reduction in MMDs. Proportions of responders in each category increased over the course of the trial.

(233) As shown above, results demonstrate that atogepant is well-tolerated in this 52-week open label study. ICH E1 exposure requirements for 6-month exposure (≥ 300 patients) and one-year exposure (≥ 100 patients) are met. The efficacy of atogepant treatment in terms of reduction in monthly migraine days, reduction in monthly headache days, reduction in acute medication use days, and $\geq 50\%$ responder rate are well-maintained for the one-year atogepant 60 mg QD treatment. A slight improvement over time was observed for the four endpoints.

(234) The change from baseline in AIM-D PDA and PI domains for the first and last timepoints assessed are shown in Table 29. The negative change scores with confidence intervals that exclude 0 indicate a significant reduction in impairment due to migraine in PDA and PI.

(235) TABLE-US-00029 TABLE 29 LS mean changes from baseline in AIM-D Performance of Daily Activities (PDA) and Physical Impairment (PI) Domain scores (mITT population, MMRM analysis) AIM-D PDA Domain AIM-D PI Domain Baseline LS mean (SE) = Baseline LS Mean (SE) = 15.0 (8.80); n = 445 11.4 (8.85); n = 445 LS Mean LS Mean (SE) change (SE) Change from from Weeks N baseline 95% CI baseline 95% CI 1-4 397 -7.61 (-8.86, -6.96) -5.56 (-6.13, -4.99) (0.329) (0.290) 49-52 247 -10.17 (-10.90, -9.44) -7.20 (-7.91, -6.50) (0.370) (0.357)

(236) The change from baseline in AIM-D monthly PDA domain score (mITT population) is shown in FIG. 16A and Table 30. The change from baseline in AIM-D monthly PI domain score (mITT population) is shown in FIG. 16B and Table 31. The LS mean change from baseline in the AIM-D PDA and PI scores demonstrated an early and consistent reduction in impairment due to migraine over the 52 week trial. Change scores with confidence intervals excluding zero were present at each time point assessed, indicating significant reduction in impairment due to migraine during the 52-week trial.

(237) TABLE-US-00030 TABLE 30 Change from Baseline in AIM-D Monthly PDA Domain Score: Reduced Impairment in Performance of Daily Activities (mITT Population) LS Mean Δ from Weeks n baseline 95% CI 1-4 397 -7.61 -8.26, -6.96 5-8 360 -8.16 -8.89, -7.42 9-12 346 -8.53 -9.22, -7.84 13-16 334 -8.66 -9.37, -7.94 17-20 323 -9.02 -9.72, -8.32 21-24 313 -9.11 -9.80, -8.43 25-28 301 -9.16 -9.88, -8.44 29-32 288 -9.22 -9.93, -8.51 33-36 288 -9.61 -10.28, -8.94 37-40 283 -9.61 -10.27, -8.95 41-44 273 -9.77 -10.48, -9.06 45-48 262 -9.79 -10.48, -9.10 49-52 247 -10.17 -10.90, -9.44

(239) The Migraine-Specific Quality of Life Questionnaire version 2.1 (MSQv2.1) Role Function-Restrictive (RFR) domain least squares (LS) mean (standard error [SE]) at baseline was 48.1 (20.26) and LS mean changes from baseline throughout the trial are shown in FIG. 17 and in Table 32. Findings indicated rapid improvement over the first 12 weeks and sustained improvement from 12 to 52 weeks, and non-zero confidence intervals throughout indicate significant improvement at each timepoint assessed.

(240) TABLE-US-00032 TABLE 32 Change from Baseline in MSQ v2.1 Domain Score (mITT Population) LS Mean Δ from Weeks n baseline 95% CI 12 495 30.02 28.16, 31.87 24 436 30.79 28.83, 32.76 36 404 32.34 30.35, 34.34 48 377 34.32 32.38, 36.25 52 363 34.70 32.74, 36.66

(241) The mean (SE) HIT-6 total score at baseline was 64.07 (4.89) and the LS mean change (95% confidence interval) at Week 4 was -7.63 (-8.31, -6.95) and at Week 52 was -12.10 (-12.98, -11.22), demonstrating reductions in headache impact. The proportion of HIT-6 responders (≥ 5 points from baseline) were 59.92% and 80.77% of participants in the first (week 4) and last (week 52) timepoints assessed, respectively. Change from baseline in HIT-6 Total Score (mITT Population) is shown in FIG. 18 and Table 33. HIT-6 total score responder rates (mITT) population are shown in Table 33. A responder on the HIT-6 was defined as a participant with a ≥ 5 point improvement from baseline.

(242) TABLE-US-00033 TABLE 33 Change from Baseline in HIT-6 Total Score (mITT Population) LS Mean Δ from Week n baseline 95% CI 4 514 -7.63 -8.31, -6.95 8 491 -9.14 -9.87, -8.42 12 471 -6.60 -10.33, -8.87 16 448 -10.15 -10.93, -9.37 20 442 -10.56 -11.35, -9.76 24 423 -10.55 -11.39, -9.71 28 418 -10.99 -11.83, -10.15 32 407 -11.15 -11.98, -10.32 36 402 -11.29 -12.14, -10.43 40 394 -11.76 -12.60, -10.91 44 384 -11.46 -12.32, -10.60 48 377 -11.86 -12.72, -10.99 52 364 -12.10 -12.98, -11.22

(244) Long-term daily use of atogepant 60 mg for the preventive treatment of migraine was

associated with reductions in the impact of migraine on the AIM-D in performance of daily activities and physical impairment, improvements in migraine-specific quality of life on the RFR domain, and reductions in the impact of headaches as assessed by changes from baseline, which were significant as indicated by non-zero confidence intervals. Improvements were observed at the earliest time point assessed and increased over the 52-week trial.

Example 3

(245) As discussed in Example 1, a phase 3 trial (Study A) demonstrated that atogepant dosed once daily results in a clinically meaningful reduction in mean monthly migraine days. An open-label extension study for trial completers evaluated the long-term safety and tolerability of oral atogepant 60 mg daily for the prevention of migraine in participants with episodic migraine.

(246) Participants in this trial (Study C) rolled over from the lead in trial (Study A) and were treated with atogepant 60 mg once daily for 40-weeks, with a 4-week safety follow-up period. Only safety data were collected.

(247) Of 695 participants screened, a total of 685 participants took at least one dose of study medication and were included in the safety population. Overall, the mean age was 41.8 years. Female participants accounted for 88.2% of the Safety Population. White and Black or African American patients accounted for 84.4% and 12.6%, respectively. Mean BMI was 30.58 kg/m². Demographics data for the Safety Population are summarized in Table 35.

(248) TABLE-US-00035 TABLE 35 Demographics and Baseline Characteristics (Safety Population) Atogepant 60 mg QD Parameter N = 685 Age (years) Mean (SD) 41.8 years (12.30) Sex, n (%) Male 81 (11.8%) Female 604 (88.2) Race Group, n (%) White 578 (84.4) Black or African American 86 (12.6) Asian 9 (1.3) American Indian or Alaska Native 3 (0.4) Native Hawaiian or Other Pacific Islander 0 Multiple [1] 8 (1.2) Missing 1 (0.1) Race Group, n (%) White 578 (84.4) All other races 106 (15.5) Missing 1 (0.1) Ethnicity, n (%) Hispanic or Latino 54 (7.9) Not Hispanic or Latino 631 (92.1) Weight (kg) Mean (SD) 84.21 (23.267) N 685 BMI (kg/m²) Mean (SD) 30.58 (7.820) n 685 [1] Participants who reported multiple races are only included in the "Multiple" category. N = number of patients in the safety population n = Number of participants within a specific category Percentages are calculated as $100 \times (n/N)$

(249) The majority of participants (74.6%) completed the open label treatment period. Overall, 62.5% of participants experienced a treatment-emergent adverse event (TEAE), with 8.8% considered treatment-related by the investigator; serious adverse events occurred in 3.4% of participants, none of which were treatment related. Table 36 reports the most frequent AEs leading to discontinuation; Table 37 reports the most frequent TEAEs observed. No deaths and no hepatic safety issues were observed.

(250) TABLE-US-00036 TABLE 36 Overall Summary of Adverse Events - Safety Population Total (N = 685) Category n/N (%) Treatment-emergent adverse event (TEAE) 428 (62.5) Deaths 0 (0.0) Treatment-emergent serious adverse events 23 (3.4) (SAE) Treatment-related TEAE 60 (8.8) TEAE Leading to Study Discontinuation [1, 2] 22 (3.2) Nausea 3 (0.4) Abdominal pain 2 (0.3) Vomiting 2 (0.3) Weight Decreased 2 (0.3) Dizziness 2 (0.3) Migraine 2 (0.3) Participants are counted only once within each category. N = number of participants in the Safety Population n = number of participants within a specific category Percentages are calculated as $100 \times (n/N)$ [1] The inset AEs represent the most frequent AEs leading to discontinuation in the extension study. [2] Three patients with AE onset date in the lead-in trial rolled over to the extension study and discontinued in the extension study.

(251) TABLE-US-00037 TABLE 37 Most Frequent ($\geq 2\%$) Treatment Emergent Adverse Events (TEAEs) by Preferred Term - Safety Population Atogepant 60 mg QD (N = 685) TEAEs by Preferred Term n (%) Upper respiratory tract infection 38 (5.5) Urinary tract infection 36 (5.3) Nasopharyngitis 33 (4.8) Sinusitis 25 (3.6) Constipation 23 (3.4) Nausea 23 (3.4) Weight decreased 18 (2.6) Back pain 17 (2.5) Dizziness 17 (2.5) Influenza 17 (2.5) Arthralgia 15 (2.2) Corona virus infection 15 (2.2) Gastroenteritis 15 (2.2) Anxiety 14 (2.0) Bronchitis 14 (2.0) Vomiting 14 (2.0)

Participants are counted only once within each preferred term. N = number of participants in the Safety Population n = number of participants within a specific category Percentages are calculated as $100 \times (n/N)$.

(252) The study supported that atogepant 60 mg once daily is safe and well tolerated. The study results contributed 538 participants exposed to atogepant for 6 months and 509 participants exposed to atogepant for 9 months.

Example 4

(253) The populations of Study A (described in Example 1) and Study B (described in Example 2) were analyzed for weight-related changes over the course of treatment.

(254) Data was also evaluated from Study C (described in Example 3) and Study D, a Phase 2b/3 clinical trial evaluating the efficacy, safety, and tolerability of orally administered atogepant. In Study D, after a 28 day baseline period, a total of 652 patients were randomized 1:2:2:2 to receive either atogepant 10 mg (n=94), atogepant 30 mg (n=185), atogepant 60 mg (n=187) or placebo (n=186).

(255) In the atogepant Study A population, 44.8% of patients had a BMI of ≥ 30 kg/m², and 58.6% of patients had a BMI ≥ 27 kg/m² with obesity-related comorbidities (e.g., Type 2 diabetes, hypertension, dyslipidemia, sleep apnea, cardiovascular disease). In the atogepant Study B population, 45.3% of patients had BMI ≥ 30 kg/m², and 54.9% of patients had BMI ≥ 27 kg/m² and obesity-related comorbidities.

(256) Statistically significant weight loss was observed in the atogepant 30 mg once daily and 60 mg once daily groups compared with placebo in Study A. The LS mean difference for percentage change from baseline in body weight at the end of the treatment period was 0.98% (p=0.0005) in the atogepant 30 mg once daily group and 1.64% (p<0.0001) in the atogepant 60 mg once daily group. CDF plots for percentage change from baseline in body weight (kg) at the end of the double-blind treatment period (week 12) for Study A (safety population) are shown in FIG. 19.

(257) Treatment with atogepant over the 52-week treatment period was associated with modest weight loss in Study B. Statistically significant weight loss was observed in the atogepant 60 mg once daily group compared with SOC. The LS mean difference for percentage change from baseline in body weight at the end of the treatment period versus SOC was -1.76% (p=0.0003). In addition, treatment with atogepant was associated with weight loss as measured by the percentage of participants who lost at least 5% of baseline body weight at the end of the treatment period. In Study B, the percentage of participants in the atogepant 60 mg once daily group who met this weight loss threshold was 22.4% compared with 14.2% in the SOC group. CDF plots for percentage change from baseline in body weight (kg) at the end of the open-label treatment period (week 52) for Study B (safety population) are shown in FIG. 20.

(258) When evaluated with both study A and study CGP-MD-01 (NCT02848326), patients had a mean body weight of 83.6 kg and a mean BMI of 30.34 kg/m². In these studies, a dose-dependent mean change in body weight was observed at the end of the double-blind treatment period as follows: +0.32 kg for placebo, +0.07 kg for atogepant 10 mg, -0.40 kg for atogepant 30 mg, and -0.81 kg for atogepant 60 mg. The proportion of patients with weight decrease $\geq 7\%$ at any point was 2.8% for placebo, 3.8% for atogepant 10 mg, 3.2% for atogepant 30 mg, and 4.9% for atogepant 60 mg. No patients in either study discontinued atogepant due to decreased weight.

(259) TABLE-US-00038 TABLE 38 Weight Loss (Study A and Study D) Atogepant Atogepant Atogepant Placebo 10 mg 30 mg 60 mg N = 408 N = 314 N = 411 (N = 417) Mean Change in +0.40 +0.07 -0.40 -0.81 weight by end of study (kg) PCS Weight 11/399 12/312 13/404 20/409 Loss >7% baseline (2.8%) (3.8%) (3.2%) (4.9%)

(260) TABLE-US-00039 TABLE 39 Weight Loss Adverse Events (CGP-MD-01 and Study A) Atogepant Atogepant Atogepant All Placebo 10 mg 30 mg 60 mg Atogepant TEAE N = 408 N = 314 N = 411 (N = 417) (N = 1142) Weight 3 (0.7%) 1 (0.3%) 0 4 (1.0%) 5 (0.4%) decreased

(261) In the 52-week open label long-term safety Study B, patients had a mean weight of 83.9 kg

and a mean BMI of 30.55 kg/m². In this study, a mean change in body weight was also observed at the end of treatment period as follows: +0.20 kg for oral preventive standard of care group and -1.42 kg for the atogepant 60 mg group. The proportion of patients with weight decrease $\geq 7\%$ at any point was 14.7% for the oral migraine preventive standard of care group and 24.1% for the atogepant 60 mg group. One patient (0.1%) in the long-term safety study discontinued atogepant 60 mg due to decreased weight.

(262) TABLE-US-00040 TABLE 40 Weight Loss Adverse Events (Study B) SOC TEAE N = 196 Atogepant 60 mg (N = 1198) Weight decreased 3 (1.5%) 25 (2.1%)

(263) Table 41 provides a subset analysis for percentage change from baseline in body weight (kg) at the end of the double-blind treatment period (week 12 (LOCF) ANCOVA) for Study A (safety population). Table 42 provides a subset analysis for 5% responders in body weight (kg) at the end of the double-blind treatment period [week 12 (LOCF) ANCOVA] for Study A (that is, Table 42 sets out a subset analysis for participants who lost at least 5% of baseline body weight at the end of the treatment period). The “Guidance Population” refers to patients with BMIs greater than or equal to 30 kg/m² or BMI greater than or equal to 27 kg/m² in the presence of obesity-related comorbidities (e.g., type 2 diabetes, hypertension, dyslipidemia, sleep apnea, cardiovascular disease).

(264) TABLE-US-00041 TABLE 41 Subset Analysis for Percentage Change from Baseline in Body Weight (kg) at the end of the double-blind treatment period [week 12 (LOCF) ANCOVA] Study A, Safety Population Subgroup Statistics Placebo Atogepant 10 mg Atogepant 30 mg Atogepant 60 mg Overall N 222 221 228 231 N = 902 Baseline 84.61 83.6 85.69 82.52 weight LS Mean 0.37 (0.20) 0.14 (0.20) -0.61 (0.20) -1.27 (0.20) (SE) LSMD vs. -0.23 (-0.79, 0.32) -0.98 (-1.53, -0.43) -1.54 (-2.19, -1.09) Placebo (95% CI) p value 0.4138 0.0005 <.0001 BMI ≥ 30 N 97 98 119 90 (S.E) Baseline 104.07 102.06 101.56 102.68 N = 404 weight LS Mean 0.52 (0.29) 0.14 (0.29) -0.36 (0.26) -1.29 (0.30) (SE) LSMD vs. -0.39 (-1.17, 0.40) -0.88 (-1.63, -0.13) -1.81 (-2.62, -1.01) Placebo (95% CI) p value 0.3345 0.021 <.0001 Guidance N 126 127 148 128 Population Baseline 98.15 96.83 97.02 95.18 (S.E) weight N = 529 LS Mean 0.36 (0.27) 0.13 (0.27) -0.63 (0.25) -1.40 (0.27) (SE) LSMD vs. -0.23 (-0.96, 0.49) -1.00 (-1.69, -0.30) -1.76 (-2.49, -1.04) Placebo (95% CI)

(269) As shown above, a clear dose-dependent weight reduction was observed for percentage change from baseline in body weight for Study A based on ANCOVA analysis. For Study A, the responder rate ($\geq 5\%$ weight loss) at week 12 was higher in the atogepant 60 mg group compared to atogepant 10 mg and 30 mg. For Study B, a clear difference in the percentages of patients who lost at least 5% of baseline body weight was observed in the atogepant 60 mg daily group (22.4%) compared to the SOC group (14.2%); it should be noted that patients in the SOC group were heterogeneous, and may have taken medications associated with weight loss, weight gain, or neither.

(270) In Study A, baseline BMI did not affect the % weight change; the placebo-adjusted difference was consistent across BMI categories. In Study B, a slightly larger weight reduction was observed in the special populations (BMI ≥ 30) based on ANCOVA analysis.

(271) The time course of weight loss associated with atogepant use was also evaluated in the Study B population. FIGS. 21-24 show CDF plots at 3 months (FIG. 21), 6 months (FIG. 22), 9 months (FIG. 23), and 12 months (FIG. 24) in the safety population based on observed data. The change from baseline in weight over time for the Study B safety population is summarized in Table 45. The percentage change from baseline in weight over time for Study B 5 (Safety Population) is shown in Table 46.

(274) As discussed above, the SOC group was heterogeneous, and encompassed multiple potential options for standard of care medications. A comparison of atogepant 60 mg to those patients who initially took topiramate is shown in Table 47.

(275) TABLE-US-00047 TABLE 47 Percentage Change from Baseline in Weight Over Time, Study B, Safety Population Atogepant 60 mg Topiramate Initial Use Week n Mean (SD) n Mean (SD) 4 529 -0.42 (2.11) 57 -0.57 (1.74) 8 498 -0.82 (2.65) 53 -0.93 (3.06) 12 480 -1.18 (3.16) 48 -1.17 (3.76) 16 456 -1.48 (3.75) 47 -0.57 (5.32) 20 446 -1.86 (4.36) 45 -0.94 (6.55) 24 243

(276) Table 48 provides a summary of final total daily dose among initial treatment in Study B. The most common daily dose for topiramate in Study B was 25 mg.

(277) TABLE-US-00048 TABLE 48 Summary of final total daily dose among initial treatment 10 mg 12.5 mg 20 mg 25 mg 50 mg 100 mg Total Amitriptyline 19 1 1 21 1 1 43 Topiramate — 2 — 33 29 6 70

(278) As shown above, in the Study B long term safety study, atogepant led to a gradual weight reduction from week 4 to week 40 (2.11 kg reduction at week 40); the weight reduction then slightly decreased to -1.54 kg at week 52, and -1.42 at the end of the OL period. At the end of the OL period, the percentage reduction of weight was -1.57 for atogepant 60 mg, and -1.14 for topiramate.

Example 5

(279) In a multicenter, randomized, double-blind, placebo-controlled, parallel-group study designed to evaluate the efficacy, safety, and tolerability of multiple doses and doses regimens of atogepant for the prevention of migraine. The patients were randomized (2:1:2:1:2:1) to 1 of 6 treatment groups: placebo, atogepant 10 mg QD, atogepant 30 mg QD, atogepant 30 mg BID, atogepant 60 mg QD, and atogepant 60 mg BID.

(280) This study consisted of a 4-week screening and baseline period and a 12-week double-blind treatment period, which was followed by a 4-week safety follow-up period. Total study duration is 20-weeks.

(281) To be randomized, eligible patients had to be 18 to 75 years of age (inclusive), have a history of migraine with or without aura for at least 1 year consistent with a diagnosis according to the International Classification of Headache Disorders criteria, 3rd edition, beta version, have experienced 4 to 14 migraine/probable migraine headache days and <15 headache days in the 28-day baseline period. Patients who had clinically significant hematologic, endocrine, cardiovascular, cerebrovascular, pulmonary, renal, hepatic, gastrointestinal, or neurologic disease were excluded from the study.

(282) A total of 834 patients were randomized to double-blind treatment (ITT population), and 825 patients took at least 1 dose of double-blind IP (safety population). A total of 795 treated patients had an evaluable baseline period of diary data and at least 1 evaluable post-baseline 4-week interval (Weeks 1-4, 5-8, or 9-12) of diary data. The primary efficacy variable was the change from baseline in mean monthly migraine/probable migraine headache days across the 12-week treatment period. The secondary efficacy variables were the change from baseline in mean monthly headache days across the 12-week treatment period, proportion of patients with at least a 50% reduction in mean monthly migraine/probable migraine headache days across the 12-week treatment period, and the change from baseline in mean monthly acute medication use days across the 12-week treatment period.

(283) Results from the study are presented in tables below:

Claims

1. A method for the preventive treatment of migraine in a patient in need thereof, the method comprising orally administering atogepant to the patient in a therapeutically effective amount of 10 mg once daily, wherein the method does not significantly affect the level of liver enzymes in the

patient.

2. The method of claim 1, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.

3. The method of claim 1, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 3.7 days in the population at 12 weeks from initiation of the method.

4. The method of claim 1, wherein the patient has 4 to 14 migraine days per month prior to the administration of atogepant.

5. The method of claim 4, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.

6. The method of claim 4, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 3.7 days in the population at 12 weeks from initiation of the method.

7. A method for the preventive treatment of migraine in a patient in need thereof, the method comprising orally administering atogepant to the patient in a therapeutically effective amount of 30 mg once daily, wherein the method does not significantly affect the level of liver enzymes in the patient.

8. The method of claim 7, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.

9. The method of claim 7, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 3.9 days in the population at 12 weeks from initiation of the method.

10. The method of claim 7, wherein the patient has 4 to 14 migraine days per month prior to the administration of atogepant.

11. The method of claim 10, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.

12. The method of claim 10, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 3.9 days in the population at 12 weeks from initiation of the method.

13. A method for the preventive treatment of migraine in a patient in need thereof, the method comprising orally administering atogepant to the patient in a therapeutically effective amount of 60 mg once daily, wherein the method does not significantly affect the level of liver enzymes in the patient.

14. The method of claim 13, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.

15. The method of claim 13, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 4.2 days in the population at 12 weeks from initiation of the method.

16. The method of claim 13, wherein the patient has 4 to 14 migraine days per month prior to the administration of atogepant.

17. The method of claim 16, wherein alanine aminotransferase (ALT) and aspartate aminotransferase (AST) levels in the patient are less than 3 times the upper limit of normal for the duration of treatment.
18. The method of claim 16, wherein when the method is used for a duration of 12 weeks to treat a population of patients with 4 to 14 migraine days per month prior to initiation of the method, the method results in a reduction in mean monthly migraine days of at least about 4.2 days in the population at 12 weeks from initiation of the method.
