### System and method for surveying broadcasting ratings

---

#### Abstract

A system and method in which a TV signal reception device (e.g., set top box) receives a broadcast signal, sends the broadcast signal to a TV, and sends an event signal to a rating statistics information server or associated user terminal when a predetermined condition occurs, to ultimately cause an associated user terminal to generate fingerprint data of audio from the TV and to provide the fingerprint data to the server so as to facilitate channel identification and generation of ratings statistics.

## Background/Summary

REFERENCE TO RELATED APPLICATIONS (1) This application is a continuation of U.S. patent application Ser. No. 17/248,035 (hereby incorporated by reference), filed Jan. 6, 2021, which is a continuation of U.S. patent application Ser. No. 15/929,183 (hereby incorporated by reference), filed Dec. 10, 2019, which is a continuation of U.S. patent application Ser. No. 16/180,523 (hereby incorporated by reference), filed Nov. 5, 2018, which is a continuation of U.S. patent application Ser. No. 15/496,888 (hereby incorporated by reference), filed Apr. 25, 2017, which is a continuation of U.S. patent application Ser. No. 14/762,570 (hereby incorporated by reference), filed Jul. 22, 2015, which is a National Stage under 35 U.S.C. § 371 of International Patent Application No. PCT/KR2013/000576, filed Jan. 24, 2013, claiming priority to Korean Patent Application No. 10-2013-0007660, filed Jan. 23, 2013.

## TECHNICAL FIELD

(1) The present invention relates to a system and method for surveying broadcast ratings and, more particularly, to a system and method for surveying broadcast ratings, which are capable of accurately and conveniently obtaining rating information regarding a broadcasting channel, which is watched by a user who watches television (TV), and meta information, such as the age, job, residential area and the like of the user.

## BACKGROUND ART

(2) TV broadcast ratings play a significantly important role from the viewpoint of an advertiser as

well as from the viewpoint of a broadcasting company, and thus TV broadcast ratings are surveyed and widely used in the scheduling of TV broadcast programs or advertising contracts. Accordingly, a method of surveying accurate TV broadcast ratings can be viewed as significantly important.

(3) A method of distributing rating survey devices having a remote controller form to predetermined TV watching homes, allowing channels, to be watched, to be selected using the rating survey devices when TV is watched in the homes, receiving corresponding information using a server, and then collecting ratings has been known as a conventional method of surveying TV broadcast ratings. Furthermore, a separate rating survey device may be distributed to each TV viewer in each home, and statistics information regarding ratings may be calculated for each person or each specific watching group.

(4) However, when the conventional method is used, a problem arises in that it is difficult to collect accurate rating information for each group because the case where the rating survey devices of counterparts are used frequently occurs in a user group in each home. Furthermore, a problem arises in that it is difficult to distribute rating survey devices to many viewers or maintain the rating survey devices because separate rating survey devices are required.

(5) Meanwhile, Korean Patent Application Publication No. 10-2005-0031304 (published on Apr. 6, 2005) relates to “Method of Surveying Digital Broadcast Ratings.” This patent publication discloses a method of surveying digital broadcast ratings, including a tenth step of broadcasting, by a broadcasting station, data, including rating survey request information, together with a broadcast program; a twentieth step of receiving, by a broadcasting receiver, the broadcast program broadcast at the tenth step, separating the data from the broadcast program, and determining whether the data includes the rating survey request information; a thirtieth step of determining a broadcast program watched by a user if it is determined at the twentieth step that the rating survey request information is included; a fortieth step of accessing a rating survey server if the broadcast program watched by the user is determined at the thirtieth step, searching the data for a service identification (ID) corresponding to the broadcast program determined to be watched, and sending the retrieved service ID; and a fiftieth step of storing, by the rating survey server, the service ID of the fortieth step in a database and surveying ratings based on the stored service ID.

(6) However, according to this method, a problem arises in that a broadcast program must be broadcast with data including rating survey request information being included therein. Furthermore, a limitation is imposed in that a broadcasting receiver must receive such data, separate the data, and determine whether the corresponding data is included. Accordingly, the above method is problematic as a broadcast rating survey method in that a data processing process is complicated and a separate reception device intended for the method must be configured and managed.

## DISCLOSURE

### Technical Problem

(7) The present invention is intended to overcome the above-described problems, and an object of the present invention is to provide a system and method that can conveniently and accurately determine the channel identification information of a broadcast channel that is watched by a user using fingerprint data, thereby generating accurate rating statistics information.

(8) Furthermore, another object of the present invention is to provide a system and method that enable a user terminal to start to extract a fingerprint when a specific condition is met in a TV signal reception device, such as a set-top box, thereby generating meaningful rating statistics information.

(9) Furthermore, still another object of the present invention is to provide a system and method that can extract a fingerprint using a user terminal, such as a smart phone, when a specific condition is met, perform matching based on the extracted fingerprint, and obtain the identification information of a TV channel, thereby generating personalized rating statistics information in various and plentiful forms.

## Technical Solution

(10) According to an aspect of the present invention, there is provided a system for surveying broadcast ratings, including: a television (TV) signal reception device configured to receive a broadcast signal, to send the broadcast signal to a TV, and to send an event signal to a rating statistics information server when a predetermined condition occurs; the rating statistics information server configured to send a fingerprint extraction request signal to a previously registered user terminal when receiving the event signal from the TV signal reception device; and the user terminal configured to extract the fingerprint data of an audio signal generated from the TV being watched by a user when receiving the fingerprint extraction request signal from the rating statistics information server, and to send the extracted fingerprint data and user identification information to the rating statistics information server; wherein the rating statistics information server obtains the channel identification information of a TV channel being watched by the user based on the fingerprint data transmitted by the user terminal, and generates rating statistics information based on the obtained channel identification information and the user identification information.

(11) In this case, the TV signal reception device may be configured to send the event signal to the rating statistics information server when broadcast signals are successively received over a specific channel for a predetermined time.

(12) Furthermore, the event signal transmitted by the TV signal reception device may include the identification information of the TV signal reception device.

(13) Furthermore, the rating statistics information server may be configured to determine one of previously registered user terminals, to which the fingerprint extraction request signal is to be transmitted, based on the identification information of the TV signal reception device included in the event signal, and to send the fingerprint extraction request signal to the determined user terminal.

(14) Furthermore, the user terminal may be configured to display a message, indicating that the fingerprint extraction request signal transmitted by the rating statistics information server has been received, and a selection interface, enabling the user to start to extract the fingerprint data of the audio signal, via a display unit when receiving the fingerprint extraction request signal, to extract the fingerprint data of the audio signal generated from the TV being watched by the user when the user selects the selection interface, and to send the extracted fingerprint data and the user identification information to the rating statistics information server.

(15) Furthermore, the user terminal may be configured to send time information about a time at which the fingerprint data is extracted, together with the extracted fingerprint data and the user identification information, to the rating statistics information server.

(16) Furthermore, the rating statistics information server may be configured to obtain the channel identification information of the TV channel being watched by the user by searching for the TV channel including fingerprint data that matches the fingerprint data transmitted by the user terminal.

(17) Furthermore, the rating statistics information server may be configured to generate the rating statistics information by storing the channel identification information of the TV channel, being watched by the user, together with information about at least one of an age, a gender, a residential area and a job stored in association with the user identification information.

(18) According to another aspect of the present invention, there is provided a method of surveying broadcast ratings, including: a first step of receiving, by a television (TV) signal reception device, a broadcast signal, sending, by the TV signal reception device, the broadcast signal to a TV, and sending, by the TV signal reception device, an event signal to a rating statistics information server when a predetermined condition occurs while sending the broadcast signal; a second step of sending, by the rating statistics information server, a fingerprint extraction request signal to a previously registered user terminal when receiving the event signal from the TV signal reception

device; a third step of extracting, by the user terminal, the fingerprint data of an audio signal generated from the TV being watched by a user when receiving the fingerprint extraction request signal from the rating statistics information server, and sending, by the user terminal, the extracted fingerprint data and user identification information to the rating statistics information server; and a fourth step of obtaining, by the rating statistics information server, the channel identification information of a TV channel being watched by the user based on the fingerprint data transmitted by the user terminal, and generating, by the rating statistics information server, rating statistics information based on the obtained channel identification information and the user identification information.

(19) According to still another aspect of the present invention, there is provided a system for surveying broadcast ratings, including: a television (TV) signal reception device configured to receive a broadcast signal, to send the broadcast signal to a TV, and to send an event signal to a user terminal when a predetermined condition occurs; the user terminal configured to extract the fingerprint data of an audio signal generated from the TV being watched by a user when receiving the event signal from the TV signal reception device, and to send the extracted fingerprint data and user identification information to a rating statistics information server; and the rating statistics information server configured to obtain the channel identification information of a TV channel being watched by the user based on the fingerprint data transmitted by the user terminal, and to generate rating statistics information based on the obtained channel identification information and the user identification information.

#### Advantageous Effects

(20) According to the present invention, there can be provided the system and method that can conveniently and accurately determine the channel identification information of a broadcast channel that is watched by a user using fingerprint data, thereby generating accurate rating statistics information.

(21) Furthermore, according to the present invention, there is achieved the effect of enabling a user terminal to start to extract a fingerprint when a specific condition is met in a TV signal reception device, such as a set-top box, thereby generating meaningful rating statistics information.

(22) Furthermore, according to the present invention, there can be provided the system and method that can extract a fingerprint using a user terminal, such as a smart phone, when a specific condition is met, perform matching based on the extracted fingerprint, and obtain the identification information of a TV channel, thereby generating personalized rating statistics information each person in various and plentiful forms.

---

## Description

### DESCRIPTION OF DRAWINGS

- (1) FIG. 1 is a diagram showing the overall configuration and connection relationship of a system **100** for surveying broadcast ratings according to an embodiment of the present invention;
- (2) FIG. 2 is a diagram showing a case where a rating statistics information server **20** generates rating statistics information in accordance with a user terminal **30**;
- (3) FIG. 3 is a diagram showing the internal configuration of the rating statistics information server **20** illustrated in FIGS. 1 and 2;
- (4) FIG. 4 is a diagram showing the internal configuration of the user terminal **30** that is used in the present invention; and
- (5) FIG. 5 is a flowchart showing an embodiment of a method according to the present invention, which is performed in the system **100** for surveying broadcast ratings, such as that described in FIGS. 1 to 4.

### BEST MODE

(6) Embodiments of the present invention are described in detail below with reference to the accompanying drawings.

(7) FIG. 1 is a diagram showing the overall configuration and connection relationship of a system **100** for surveying broadcast ratings according to an embodiment of the present invention.

(8) Referring to FIG. 1, the system **100** for surveying broadcast ratings of the present embodiment includes a TV signal reception device **10**, a rating statistics information server **20**, and a user terminal **30**.

(9) In FIG. 1, the TV signal reception device **10** is directly connected to TV **40**. The TV signal reception device **10**, the rating statistics information server **20**, and the user terminal **30** are connected over a network, such the Internet or a mobile communication network.

(10) The TV signal reception device **10** functions to receive a broadcast signal and send the broadcast signal to the TV **40**, and also functions to send an event signal to the rating statistics information server **20** when a predetermined condition occurs. The TV signal reception device **10** may be, for example, a conventionally known set-top box for receiving cable TV broadcast signals. The function of performing the present invention, i.e., a configuration for sending an event signal to the rating statistics information server **20** when a predetermined condition occurs, may be implemented in hardware or software, and the hardware or software may be included in the set-top box.

(11) That is, the TV signal reception device **10** of the present invention may be configured in a conventional set-top box or another device in an integrated manner as long as it includes a means in which the function of receiving a broadcast signal and sending the broadcast signal to a TV and the function of sending an event signal to the rating statistics information server **20** when a predetermined condition occurs have been implemented by hardware or software. In some cases, the TV signal reception device **10** may be implemented as a separate device.

(12) The TV signal reception device **10** sends an event signal to the rating statistics information server **20** when a predetermined condition occurs. In this case, the predetermined condition may be, for example, a case where broadcast signals are successively received through a specific channel for a predetermined period. That is, when a user continues to watch a specific TV channel for a specific or longer period, the TV signal reception device **10** may send an event signal to the rating statistics information server **20**.

(13) In this case, the event signal preferably includes the identification information of the TV signal reception device **10**. The identification information of the TV signal reception device **10** may be the same as an ID uniquely assigned to each TV signal reception device **10**. The rating statistics information server **20** may determine the TV signal reception device **10**, which has sent the event signal, based on the identification information.

(14) The rating statistics information server **20** functions to send a fingerprint extraction request signal to a user terminal that has been previously registered when the event signal is received from the TV signal reception device **10**. As described above, the rating statistics information server **20** may receive the identification information of the TV signal reception device **10**, together with the event signal, from the TV signal reception device **10**. The rating statistics information server **20** may determine a user terminal, which has been previously registered, in accordance with the received identification information of the TV signal reception device **10**, and may send the fingerprint extraction request signal to the determined user terminal **30**. In this case, it is preferred that the rating statistics information server **20** may previously register, for example, the telephone number of the user terminal **30** in accordance with the identification information of the TV signal reception device **10** and send the fingerprint extraction request signal based on the registered telephone number of the user terminal **30**.

(15) A method by which the fingerprint extraction request signal is sent to the user terminal **30** is not particularly limited, but a conventionally known technology may be used without change as the method. For example, the fingerprint extraction request signal may be sent to the user terminal **30**

in the form of a message, such as an SMS or MMS message. Alternatively, when the user terminal **30** is a so-called smart phone, the fingerprint extraction request signal may be sent in the form of a messaging service using an application. As will be described later, when a fingerprint extraction request signal is received from the rating statistics information server **20**, the user terminal **30** extracts the fingerprint data of an audio signal generated from a TV being watched by a user, and sends the extracted fingerprint data and user identification information to the rating statistics information server **20**. This function may be implemented in an application form when the user terminal **30** is a smart phone. When a messaging service function is also included in the application, a fingerprint extraction request signal may be sent in the form of a messaging service between the rating statistics information server **20** and the user terminal **30**. As an example of the messaging service, a method, such as Google Cloud Message Service from Google Inc., may be used. Furthermore, any conventionally known method may also be applied to the present invention without change. Since the present invention is not intended for a message service itself, a detailed description thereof is omitted.

(16) When receiving a fingerprint extraction request signal from the rating statistics information server **20**, the user terminal **30** functions to extract the fingerprint data of an audio signal generated from a TV being watched by a user and send the extracted fingerprint data and user identification information to the rating statistics information server **20**.

(17) In the present invention, the user terminal **30** may be a computer, a notebook, a tablet PC, or a mobile communication terminal. The user terminal **30** is preferably a so-called smart phone in which an application can be installed and which has the function of accessing a network, such as the Internet.

(18) In the user terminal **30**, the function of extracting the fingerprint data of an audio signal generated from a TV being watched by a user and sending the extracted fingerprint data and user identification information to the rating statistics information server **20** when a fingerprint extraction request signal is received from the rating statistics information server **20**, as described above, may be implemented in an application form. Furthermore, it is preferable to also include a configuration for receiving a fingerprint extraction request signal from the rating statistics information server **20** and sending fingerprint data and user identification information to the rating statistics information server **20**, as described above. It will be apparent that this configuration may be implemented in the operating system of the user terminal **30** in an integrated manner and or may be implemented in an integrated manner in terms of hardware.

(19) When receiving a fingerprint extraction request signal from the rating statistics information server **20**, the user terminal **30** may be allowed to immediately extract the fingerprint data of an audio signal generated from a TV being watched by a user automatically and send the extracted fingerprint data and user identification information to the rating statistics information server **20**. In this case, when the fingerprint extraction request signal is received the audio signal generated from a TV is automatically obtained and the fingerprint data of the obtained audio signal is extracted by the application or operating system of the user terminal **30** without the intervention of a user. In this case, since the user terminal **30** automatically operates and is thus unable to separately identify an audio signal generated from a TV, the user terminal **30** obtains an audio signal, obtained by an audio signal acquisition means, such as the microphone of the user terminal **30**, without change.

(20) Meanwhile, there may be a case where the user terminal **30** is not placed near the TV **40**. In this case, the user terminal **30** may obtain an audio signal and extract fingerprint data through the intervention of a user. For example, when the user terminal **30** receives the fingerprint extraction request signal transmitted by the rating statistics information server **20**, the user terminal **30** may be allowed to display a message indicating that the fingerprint extraction request signal has been received and a selection interface enabling a user to start extracting the fingerprint data of an audio signal via a display unit. When the user selects the selection interface, the user terminal **30** may be allowed to extract the fingerprint data of the audio signal generated from a TV being watched by

the user and send the extracted fingerprint data and user identification information to the rating statistics information server **20**. In this case, the message output to the display unit may include a message, for example, "Please place the user terminal near TV" or the like, and a selection part, such as "Start to extract fingerprint data. OK," is displayed on the selection interface. Accordingly, when the user heads for the TV or places the user terminal **30** near the TV and selects the selection interface, the user terminal **30** may start to extract the fingerprint data of an audio signal obtained while the audio signal is being obtained.

(21) Meanwhile, in the present invention, the fingerprint data refers to characteristic data indicative of the characteristics of data, such as audio data, image data or video data, and is also referred to as fingerprint data, DNA data, or gene data. Conventional several methods have been proposed as a technology for extracting such fingerprint data and performing the comparison of data using the extracted fingerprint data. Recently, since the identity of data can be easily determined using such a fingerprint finger, print data is widely used in the field of digital rights management (DRM). For example, in the case of audio data, fingerprint data may be generated using various types of characteristic data (e.g., frequency, amplitude, etc.) indicative of the characteristics of the audio data. In the case of image or video data, fingerprint data may be generated using various types of characteristic data (e.g., the motion vector information and color information of a frame, etc.) of the image or video data. Since the present invention is not intended for a method of extracting (generating) such fingerprint data itself and any type of fingerprint generation/extraction method according to a conventional technology may be used without change, a detailed description thereof is omitted. According to Korean Patent Application Nos. 10-2007-0044251 (entitled "Method and Apparatus for Generating Audio Fingerprint Data and Comparing Audio Data Using the Same"), 10-2007-0054601 (entitled "Method and Apparatus for Determining Identity and Detecting Common Frame of Moving Picture Data"), 10-2007-0060978 (entitled "Method and System for Clustering Moving Picture Data Having Identity"), 10-2007-0071633 (entitled "Method and Apparatus for Providing Video Data Search Service Using Data Cluster"), 10-2007-0091587 (entitled "Method and Apparatus for Setting and Providing Advertisement Data Using Video Data Cluster"), and 10-2008-0051688 (entitled "Method of Processing Moving Picture and Apparatus thereof") filed by the present applicant, a method of generating the fingerprint data of audio, image or video data and a method of performing the comparison of data using such fingerprint data are described. It will be apparent that the fingerprint data extraction method of the present applicant may also be used in the present invention. In short, a conventional fingerprint extraction method may be used in the present invention without change regardless of the type of method of extracting fingerprint data.

(22) The user terminal **30** extracts fingerprint data while obtaining an audio signal. In this case, the user terminal **30** extracts the fingerprint data of the audio signal during a specific time T after it has started to operate. Although the discrimination capability of fingerprint data increases as the time T increases, time delay in data processing and a network load problem occur, and thus the time T is preferably selected within an appropriate range.

(23) Furthermore, the user terminal **30** may be allowed to also obtain time information about the time at which fingerprint data is extracted while extracting the fingerprint data and send the obtained time information, together with the fingerprint data, to the rating statistics information server **20**.

(24) Furthermore, the user terminal **30** may send user identification information, together with fingerprint data, to the rating statistics information server **20**. In this case, the user identification information may be the same as an identifier (ID) uniquely set in each user. The user identification information may be used when the rating statistics information server **20** generates rating statistics information.

(25) Meanwhile, the rating statistics information server **20** obtains the channel identification information of a TV channel that is watched by a user based on fingerprint data transmitted by the

user terminal **30** and generates rating statistics information based on the obtained channel identification information and user identification information.

(26) For this purpose, the rating statistics information server **20** extracts fingerprint data for each specific time with respect to the audio signals of broadcast signals in real time while receiving all broadcast signals broadcast over a TV channel. The rating statistics information server **20** also stores time information about the time at which the fingerprint data is extracted, together with the extracted fingerprint data. When the fingerprint data and the time information are transmitted by the user terminal **30** in this state, the rating statistics information server **20** may obtain the channel identification information of the TV channel corresponding to the fingerprint data transmitted by the user terminal **30** by searching for fingerprint data that matches the received fingerprint data. In this case, when the time information is additionally used, the accuracy of search can be increased. All conventional methods may be used as a method of performing comparison and matching regarding the fingerprint data. Since the present invention is not intended for a fingerprint matching method itself, a detailed description thereof is omitted.

(27) The fingerprint data that matches fingerprint data transmitted by the user terminal **30** may be searched for using the above process, and thus the channel identification information of a TV channel can be conveniently determined.

(28) Once the channel identification information of the TV channel corresponding to the fingerprint data transmitted by the user terminal **30** has been determined, as described above, rating statistics information is generated by storing the channel identification information of the TV channel that is being watched by a user, together with information about at least one of an age, a gender, a residential area and a job stored in association with user identification information, i.e., the identifier (ID) of the user terminal **30** transmitted by the user terminal **30**, in accordance with the user identification information.

(29) FIG. 2 is a diagram showing a case where the rating statistics information server **20** generates rating statistics information in accordance with the user terminal **30**.

(30) As shown in FIG. 2, it may be seen that a gender, an age, a residential area, TV channel identification information, occurrence time information, and other user-related information are generated in accordance with the ID of each user terminal **30**. In this case, the ID of the user terminal **30** is transmitted by the user terminal **30**. Meanwhile, user age information and residential area information may be previously stored in accordance with the ID of the user terminal **30**.

(31) The TV channel identification information is determined by the rating statistics information server **20** through a process, such as that described above, and the occurrence time information is stored using the information transmitted by the user terminal **30** or the time information obtained by the rating statistics information server **20**.

(32) The user-related information, other than the information illustrated in FIG. 2, may be used when necessary.

(33) FIG. 3 is a diagram showing the internal configuration of the rating statistics information server **20** illustrated in FIGS. 1 and 2.

(34) As described above, the rating statistics information server **20** functions to receive an event signal from the TV signal reception device **10**, to send a fingerprint extraction request signal to the user terminal **30** that has been previously registered, to obtain the channel identification information of a TV channel being watched by a user based on fingerprint data transmitted by the user terminal **30**, and to generate rating statistics information based on the obtained channel identification information and user identification information.

(35) For this purpose, the rating statistics information server **20** includes an event signal reception unit **21**, a fingerprint extraction request signal transmission unit **22**, a TV channel identification unit **23**, and a rating statistics information generation unit **24**.

(36) The event signal reception unit **21** functions to receive an event signal generated and transmitted by the TV signal reception device **10**. The fingerprint extraction request signal

transmission unit **22** functions to identify the user terminal **30** that has been previously registered when receiving an event signal from the TV signal reception device **10**, and to send a fingerprint extraction request signal to the confirmed user terminal **30**.

(37) The TV channel identification unit **23** functions to receive fingerprint data and time information from the user terminal **30**, to identify a TV channel being watched by a user by performing matching on the fingerprint data based on the received fingerprint data and time information, and to obtain TV channel identification information. Furthermore, the rating statistics information generation unit **24** functions to generate rating statistics information, such as that illustrated in FIG. 2, in accordance with the ID of the user terminal **30**, and to store and manage the generated rating statistics information.

(38) FIG. 4 is a diagram showing the internal configuration of the user terminal **30** that is used in the present invention.

(39) As described above, the user terminal **30** functions to receive a fingerprint extraction request signal from the rating statistics information server, to extract the fingerprint data of an audio signal generated from a TV being watched by a user, and to send the extracted fingerprint data and user identification information to the rating statistics information server.

(40) For this purpose, the user terminal **30** includes a fingerprint extraction request signal reception unit **31**, a fingerprint extraction unit **32**, and a fingerprint data/user identification information transmission unit **33**.

(41) The fingerprint extraction request signal reception unit **31** functions to receive a fingerprint extraction request signal transmitted by the rating statistics information server **20**. The fingerprint extraction unit **32** functions to extract the fingerprint data of an audio signal generated from a TV being watched by a user when a fingerprint extraction request signal is received. The fingerprint data/user identification information transmission unit **33** functions to send the extracted fingerprint data and user identification information (the ID of the user terminal **30**) to the rating statistics information server **20**.

(42) FIG. 5 is a flowchart showing an embodiment of a method according to the present invention, which is performed in the system **100** for surveying broadcast ratings, such as that described in FIGS. 1 to 4.

(43) Referring to FIG. 5, first, the TV signal reception device **10** sends an event signal to the rating statistics information server **20** at step **S110** when a predetermined condition occurs, as in the case where a user continues to stay in a specific channel at step **S100**.

(44) When the event signal is received from the TV signal reception device **10**, the rating statistics information server **20** identifies the user terminal **30** that has been previously registered and sends a fingerprint extraction request signal to the confirmed user terminal **30** at step **S120**.

(45) Thereafter, when the fingerprint extraction request signal is received from the rating statistics information server **20**, the user terminal **30** extracts the fingerprint data of an audio signal generated from a TV being watched by the user at step **S130**, and sends the extracted fingerprint data and user identification information to the rating statistics information server **20** at step **S140**.

(46) The rating statistics information server **20** obtains the channel identification information of a TV channel being watched by the user by performing matching on the fingerprint data using a method, such as that described above, based on the fingerprint data transmitted by the user terminal **30** at step **S150**, and generates rating statistics information in a form, such as that of FIG. 2, based on the obtained channel identification information and the user identification information at step **S160**.

(47) Although the present invention has been described with reference to preferred embodiments of the present invention, the present invention is not limited to these embodiments, and it will be apparent to those skilled in the art that modified and changed practice can be performed in various forms.

(48) For example, the TV signal reception device **10** may register information about the user

terminal **30** and send the user terminal information to the rating statistics information server **20**. In this case, the TV signal reception device **10** may not send the ID of the TV signal reception device **10**. The rating statistics information server **20** may be allowed to send a fingerprint extraction request signal to the user terminal **30** based on the received user terminal information (ID).

(49) Furthermore, the rating statistics information of FIG. 2 is illustrative, and it will be apparent that the rating statistics information may be generated in a form different from that illustrated in FIG. 2.

(50) Furthermore, according to another embodiment of the present invention, when a predetermined condition occurs, the TV signal reception device **10** may be configured to send an event signal to the user terminal **30** instead of sending the event signal to the rating statistics information server **20**. In this case, identification information, such as the telephone number of the user terminal **30** that will receive the event signal, has been previously registered in the TV signal reception device **10**. Once an event signal has been received, the user terminal **30** extracts fingerprint data, and sends user identification information, together with the extracted fingerprint data, to the rating statistics information server **20**. The rating statistics information server **20** generates rating statistics information using a process identical to that of the aforementioned embodiment.

(51) Meanwhile, in the aforementioned embodiment, the configurations of the user terminal **30** and the TV signal reception device **10** may be implemented as hardware or software. It will be apparent to those skilled in the art that when the configurations are implemented as software, they may be configured in an operating system in an integrated manner and or may be implemented using a separate application.

(52) Furthermore, according to another embodiment of the present invention, the TV channel identification unit **23** of the rating statistics information server **20** may be configured as an external separate server. The process of identifying a TV channel through fingerprint matching may be processed by the separate server, and the result value (channel identification information) of the process may be transferred to the rating statistics information server **20**.

(53) Furthermore, according to still another embodiment of the present invention, the user terminal **30** may obtain only an audio signal without extracting a fingerprint and send the audio signal to the rating statistics information server **20**. The rating statistics information server **20** may extract a fingerprint from the received audio signal.

## Claims

1. A method comprising: receiving by a television (TV) signal reception device a broadcast TV signal; detecting by the TV signal reception device when the broadcast TV signal is a given TV channel for a predetermined time; and responsive to the detecting, sending from the TV signal reception device to a user terminal a control signal that causes the user terminal to generate fingerprint data from the TV channel and to send the generated fingerprint data to a server to enable the server to determine channel identification information of the broadcast TV signal and generate rating statistics information.
2. The method of claim 1, wherein the TV signal reception device is a set top box.
3. The method of claim 2, wherein the TV signal reception device is a cable TV set top box.
4. The method of claim 2, further comprising the TV signal reception device providing the received broadcast TV signal to a TV.
5. The method of claim 1, wherein the TV channel comprises audio, and wherein the fingerprint data generated by the user terminal comprises fingerprint data of the audio.
6. The method of claim 1, wherein the user terminal is preregistered in association with the TV signal reception device.
7. The method of claim 6, wherein identification information of the user terminal is registered in

the TV signal reception device.

8. The method of claim 7, wherein the user terminal has a telephone number, and wherein the identification information comprises the telephone number of the user terminal.

9. The method of claim 1, wherein the control signal causes the user terminal to send to the server at least the generated fingerprint data and user identification information.

10. The method of claim 1, wherein the control signal causes the user terminal to send to the server at least the generated fingerprint data and time information about a time at which the fingerprint data is generated.

11. A television signal (TV) reception device configured to receive a broadcast TV signal, wherein the TV signal reception device is configured to detect when the broadcast TV signal is a given TV channel for a predetermined time, and wherein the TV signal reception device is configured to respond to the detecting by sending to a user terminal a control signal that causes the user terminal to generate fingerprint data from the TV channel and to send the generated fingerprint data to a server to enable the server to determine channel identification information of the broadcast TV signal and generate rating statistics information.

12. The TV signal reception device of claim 11, wherein the TV signal reception device is a set top box.

13. The TV signal reception device of claim 12, wherein the TV signal reception device is a cable TV set top box.

14. The TV signal reception device of claim 12, wherein the TV signal reception device is configured to provide the received broadcast TV signal to a TV.

15. The TV signal reception device of claim 11, wherein the TV channel comprises audio, and wherein the fingerprint data generated by the user terminal comprises fingerprint data of the audio.

16. The TV signal reception device of claim 11, wherein the TV signal reception device has a preregistration of the user terminal.

17. The TV signal reception device of claim 16, wherein the preregistration of the user terminal includes identification information of the user terminal.

18. The TV signal reception device of claim 17, wherein the user terminal has a telephone number, and wherein the identification information comprises the telephone number of the user terminal.

19. The TV signal reception device of claim 11, wherein the control signal causes the user terminal to send to the server at least the generated fingerprint data and user identification information.

20. The TV signal reception device of claim 11, wherein the control signal causes the user terminal to send to the server at least the generated fingerprint data and time information about a time at which the fingerprint data is generated.
