QUICK TAKE-DOWN FIREARM

Abstract

Quick take-down firearms and methods of using quick-take down firearms. The quick-take down includes an upper receiver coupling and a barrel coupling. The quick take-down can be unlocked by sliding a sliding lock collar in a translational motion to an unlocked position to release locking elements from a locked configuration. In the unlocked position, a barrel and handguard may be installed onto and removed from the upper receiver of the firearm. Releasing the sliding lock collar returns it to a locked position, securing the barrel and handguard to the upper receiver.

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS [0001] This patent is a Continuation of U.S. non-provisional patent application Ser. No. 17/061,119 filed Oct. 1, 2020 for a “QUICK TAKE-DOWN FIREARM,” which is a Continuation of U.S. non-provisional patent application Ser. No. 16/243,304 filed Jan. 9, 2019 now issued as U.S. Pat. No. 10,830,551 for a “QUICK TAKE-DOWN FIREARM,” which is a Continuation-in-Part of U.S. non-provisional patent application Ser. No. 15/657,958 filed Nov. 21, 2016 now issued as U.S. Pat. No. 10,222,157 for a “Quick Take-Down Firearm,” which is a Continuation-in-Part of U.S. non-provisional patent application Ser. No. 15/357,538, filed Nov. 21, 2016 now issued as U.S. Pat. No. 9,879,935 for a “Quick Take-Down Firearm,” which claims the benefit of U.S. provisional patent application No. 62/314,758, filed Mar. 29, 2016 for a “Straight-in, rifle barrel attachment & detachment using a ball bearing positive lock,” the contents of all of which are incorporated in their entirety by this reference. [0002] U.S. non-provisional patent application Ser. No. 15/657,958 filed Nov. 21, 2016 for a “Quick Take-Down Firearm” also claims the benefit of U.S. provisional patent application No. 62/433,696, filed Dec. 13, 2016 for an “Upper receiver and barrel designed with integrated, straight-in, positive lock coupling,” the contents of which are incorporated in their entirety by this reference.

FIELD OF THE INVENTION

[0003] The present invention relates to firearms, and more particularly to a firearm having a quick take-down coupling that releasably secures a rifle barrel to an upper receiver.

BACKGROUND OF THE INVENTION

[0004] AR-15, AR Pistols, M4, M16 and similar prior art MILSPEC rifles cannot be quickly disassembled and reassembled where the rifle barrel connects to the upper receiver, a process which usually requires the use of specialized tools and a work-bench equipped with a vise. While there are some prior art systems that allow for in-field tool-less disassembly and reassembly of the barrel from the upper receiver, these systems are not effective or robust, are complicated to use, and do not allow for use of standard MILSPEC had guards and other accessories commonly used with these types of firearms.

SUMMARY OF THE INVENTION

[0005] This patent is for quick-take down firearms and methods of using quick-take down firearms.

[0006] In one non-limiting example, the quick-take down includes an upper receiver coupling configured to be secured to an upper receiver threading of the firearm, the upper receiver coupling including several rotationally offset gas tube tunnels extending through the upper receiver coupling; further includes a rifle barrel coupling configured to be secured to a barrel of the firearm; and further includes a sliding lock collar configured to be slid in a translational motion between a locked position and an unlocked position, the sliding lock collar biased to the locked position; when the sliding lock collar is in the unlocked position the barrel of the firearm can be removed from and installed on the upper receiver; when the sliding lock collar is in the locked position and

the barrel is installed on the upper receiver the upper receiver coupling is secured to the rifle barrel coupling thereby securing the barrel to the upper receiver.

[0007] In one non-limiting example, a method of assembly for a quick take-down firearm includes: sliding a sliding lock collar in a translational motion to an unlocked position to release a plurality of locking elements from a locked configuration, in which the sliding lock collar is biased away from the unlocked position towards a locked position; next, while the sliding lock collar is held at the unlocked position, inserting a barrel of the firearm into an upper receiver of the firearm, in which an upper receiver coupling is secured to threading of the upper receiver, the upper receiver coupling comprising a gas tube tunnel extending through a body of the upper receiver coupling and a barrel coupling is secured to the barrel; next inserting the barrel into the upper receiver further comprises inserting a barrel pin of the barrel into a notch of the upper receiver threading, and inserting a gas tube of the barrel through the gas tube tunnel of the upper receiver coupling; and next, after inserting the barrel into the upper receiver, releasing the sliding lock collar such that it slides in the translational motion to the locked position to secure the upper receiver coupling to the barrel coupling.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

[0008] FIG. 1 shows an example of a prior art firearm.

[0009] FIG. 2 shows the firearm of FIG. 1 with the barrel and handguard disassembled from the upper receiver.

[0010] FIG. 3 shows the upper receiver of the firearm of FIG. 1 in more detail.

[0011] FIGS. 4A-4B show an end of the barrel of the firearm of FIG. 1 in more detail.

[0012] FIG. 5A schematically shows an example of a quick take-down coupling installed on a firearm.

[0013] FIGS. 5B-5E show end and cross-sectional views of the quick take-down coupling of Figure 5A.

[0014] FIG. 6 shows an example of an upper receiver coupling component in a disassembled condition.

[0015] FIGS. 7A-7D show an example of a body of an upper receiver coupling component.

[0016] FIGS. 8A-8C show an example of a sliding lock collar of an upper receiver coupling component.

[0017] FIGS. 8D-8E schematically show an example of an upper receiver coupling component in unlocked and locked configurations respectively.

[0018] FIGS. 9A-9C show an example of a face plate of an upper receiver coupling component.

[0019] FIGS. 10A-10C show an example of a barrel coupling component.

[0020] FIG. 11 schematically shows an example of a barrel coupling component mounted on a barrel.

[0021] FIG. 12 schematically shows an example of a protective cap for a gas tube and barrel end.

[0022] FIG. 13 shows an example of a quick take-down coupling that is integrated into the upper receiver and barrel of a firearm, shown with the barrel un-coupled from the upper receiver.

[0023] FIG. 14 shows the firearm of FIG. 13 with the barrel coupled to the upper receiver.

[0024] FIG. 15 shows the upper receiver of the firearm of FIG. 13.

[0025] FIG. 16 shows the components of the integrated upper receiver coupling of FIG. 13.

[0026] FIGS. 17A-17B show the integrated upper receiver coupling of FIG. 13 in more detail.

[0027] FIG. 18 shows the barrel of the firearm of FIG. 13.

[0028] FIG. 19 shows an end view of the barrel of FIG. 18.

[0029] FIG. 20 shows another example of a firearm with an integrated quick take-down coupling,

shown with the barrel uncoupled from the upper receiver.

[0030] FIG. **21** shows the firearm of FIG. **20** with the barrel coupled to the upper receiver.

[0031] FIG. **22** shows another example of a barrel for a quick take-down firearm.

[0032] FIG. **23** shows a cross section of another example of a barrel for a quick take-down firearm.

[0033] FIG. **24** shows an exploded view of an embodiment of a quick detach facility for a firearm.

[0034] FIG. **25** shows an exploded sectional view of the embodiment of a quick detach facility for a firearm of FIG. **24** with a barrel.

[0035] FIG. **26** shows a right side view of the embodiment of a quick detach facility for a firearm of FIG. **24** attaching the barrel of FIG. **25** to a frame/upper receiver.

[0036] FIG. **27A** is a side sectional view of the embodiment of a quick detach facility for a firearm of FIG. **24** attaching the barrel of FIG. **25** to the frame/upper receiver of FIG. **26**.

[0037] FIG. **27B** is an enlargement of the rectangular area **27B** of FIG. **27A**.

[0038] FIG. **28A** is a side sectional view of the embodiment of a quick detach facility for a firearm of FIG. **24** showing the barrel of FIG. **25** being detached from the frame/upper receiver of FIG. **26**.

[0039] FIG. **28B** is an enlargement of the rectangular area **28B** of FIG. **28A**.

[0040] The same reference numerals refer to the same parts throughout the various figures.

DESCRIPTION OF THE CURRENT EMBODIMENT

[0041] An embodiment of the quick detach facility for a firearm of the present invention is shown and generally designated by the reference numeral **500**.

[0042] FIGS. **1** and **2** show a prior art firearm, which, in this example, is an AR-15. The quick take-down couplings described in this patent are not limited to use with AR-15's, however, and may be used with a wide variety of firearms where it may be desirable to be able to quickly take down and assemble a firearm. As non-limiting examples, the quick take-down couplings of this patent may also be used with M4's, M16's, and similar MILSPEC rifles.

[0043] The firearm of FIGS. **1** and **2** includes an upper receiver **10**, a barrel **12**, and a handguard **14**. FIG. **1** shows the firearm assembled with the barrel **12** and handguard **14** attached to the upper receiver **10**. FIG. **2** shows the firearm disassembled with the barrel **12** and handguard **14** removed as a unit from the upper receiver **10**.

[0044] FIG. **3** shows in more detail an example of a prior art upper receiver **10**. The upper receiver **10** includes an opening **16** for receiving an end of the barrel **12**, threads **18** surrounding the opening **16**, a notch **20** in the threads **18**, and reference surface **22** (e.g. the shoulder where threading **18** ends). FIG. **3** also shows another opening **24** in the upper receiver **10** for receiving a gas tube or piston that facilitates cycling of the firearm (FIG. **2** shows a gas tube **26**).

[0045] FIGS. **4A** and **4B** show in more detail an example of a prior art barrel **12**. The barrel **12** includes on its outer surface a reference surface **28** (e.g. a ridge extending around the barrel) and a pin **30**.

[0046] In the prior art, the barrel **12** was attached to the upper receiver **10** by inserting the end of the barrel **12** into the upper receiver's opening **16** until the barrel reference surface **28** contacted the reference surface of the upper receiver **22** and the pin **30** was fully seated in the notch **20**. Next, a barrel nut (not shown) would be threaded onto the threads **18** of the upper receiver **10** to secure the barrel **12** in the opening **16**. A handguard (e.g. such as handguard **14** shown in FIGS. **1** and **2**) could be secured by threading the handguard onto exterior threads of the barrel nut or in other manners.

Quick Take-Down Coupling Example

[0047] FIGS. **5A-5E** show an example of a quick take-down coupling that can be used with the firearm of FIGS. **1-4** to provide quick and easy installation and removal of the barrel from the upper receiver. The quick take-down coupling of FIGS. **5A-5E** includes an upper receiver coupling **32** and a barrel coupling **34**. The upper receiver coupling **32** secures to the threads **18** of the upper receiver. The barrel coupling **34** secures to the barrel **12** proximate the reference surface **28** and pin **30**. The quick take-down coupling has a locking mechanism, described in further detail below, for locking and unlocking the upper receiver coupling **32** from the barrel coupling **34**, providing for

quick and easy installation and removal of the barrel **12** from the upper receiver **10**. FIGS. 5A-5E provide a general overview of the upper receiver coupling **32** and barrel coupling **34** components, and do not show all of the individual elements of those components.

[0048] FIGS. **6** through **9** show the upper receiver coupling **32** of FIG. **5** in further detail. Referring to FIG. **6**, the upper receiver coupling **32** includes, from left to right, a body **36**, locking elements **38**, resilient element **40**, sliding lock collar **42**, and face plate **44**. The resilient element **40** is shown in FIG. **6** as a coil spring, although other types of resilient elements may be used, such as a wave spring.

[0049] FIGS. 7A-7D show the body **36** of FIG. **6** in further detail. The body **36** includes an opening **46** extending through it from one end to the other. At least a portion of the opening **46** includes interior threading **48** (see FIG. **6**) which is configured to engage the exterior threading **18** of the upper receiver **10**. In other words, the pitch, thread angle, major diameter, minor diameter, etc. of the threading **48** of the body **36** is configured to correspond with the pitch, thread angle, major diameter, minor diameter, etc. of the threading **18** of the upper receiver **10**. In some embodiments, the body threading **48** is MILSPEC or other standardized threading allowing it to be installed on a wide variety of commercially available firearms. The body **36** of FIGS. 7A-7D also includes through holes **50** around the perimeter of the body **36** for receiving set screws or similar items to further secure the upper receiver coupling **32** to the upper receiver threads **18**. In some embodiments, the set screws used may be nylon or another relatively soft material to lessen the risk of damaging the upper receiver threads **18**.

[0050] The body **36** of FIGS. 7A-7D further includes apertures **52** spaced around the body **36** configured to receive locking elements **38** (e.g. ball bearings) such that portions of the locking elements may protrude into the opening **46** of the body **36** when the upper receiver coupling **32** is in a locked configuration (discussed further below). As shown in FIG. 7D, the apertures taper so that, in cooperation with the shape of the locking elements **38**, the amount of penetration of the locking elements **38** into the opening **46** is limited.

[0051] The body **36** of FIGS. 7A-7D further includes several tunnels **54** extending through the length of the body from one end to the other. The tunnels **54** are configured to allow passage of a gas tube or piston associated with the barrel **12** through the body **36** and into the opening **24** on the upper receiver. As shown in FIGS. 7A-7C, the tunnels **54** are rotationally offset from one another (in this example, there are four tunnels **54** spaced apart 90 degrees from adjacent tunnels **54**) and also rotationally offset from the apertures **52** in the body **36**. In this example, the tunnels **54** are rotationally offset to allow for proper alignment of one of the tunnels **54** with the opening **24** in the upper receiver **10** when the upper receiver coupling **32** is secured to the upper receiver threads **18** at a desired torque or within a desired torque range.

[0052] In other embodiments, tunnels are not necessary. For example, in some embodiments, the quick-take down system may be used with an AR Pistol or other firearm that uses direct blowback cycling, without the need for a gas tube or piston.

[0053] The body **36** of FIGS. 7A-7D further includes a flange or shoulder **56** and openings **58**, the purposes of which will be described further below.

[0054] FIGS. 8A-8C show the sliding lock collar **42** of FIG. **6** in further detail. The collar **42** has an opening extending through it with an innermost internal diameter of sufficient dimension to allow the collar **42** to fit over a portion of the body **36** in a sliding fashion. The collar **42** may be slid in a translational motion along the body **36** (e.g. straight along the body **36** without rotation of the collar **42** relative to the body **36**).

[0055] The opening of collar **42** includes a recessed area terminating at shoulder **60** at one end of the collar **42**. The recess is configured to contain the resilient element **40** shown in FIG. **6**, with one end of the element **40** acting against shoulder **56** and the other end of the element **40** acting against shoulder **60** such that collar **42** is biased away from the shoulder **56** of body **36** towards the other end of the body **36**.

[0056] The opening of collar **42** also includes a second recess at the other end of the collar **42**. In this particular example, second recess is formed by ramped surface **62**. When the collar **42** is biased away from the shoulder **56** of body **36**, the ramped surface **62** acts on locking elements **38** to cause those elements to protrude into the openings **46** of body **36** (see FIG. **8D**) in a locked position. When the collar **42** is pulled back against the bias of resilient element **40**, the locking elements **38** are unlocked and can move out of the openings **46** (see FIG. **8E**).

[0057] FIGS. **9A-9C** show the face plate **44** of FIG. **6** in more detail. The face plate includes a central opening **64** and tunnel portions **66** corresponding to the opening **46** and tunnels **54** of body **36**. The outer diameter of the face plate **44** is of sufficient size so that when it is secured to the end of body **36** (e.g. using fasteners passing through fastener openings **68** in face plate **44** and into openings **58** in body **36**), the face plate **44** limits the sliding movement of collar **42** away from the shoulder **56** of body **36**.

[0058] FIGS. **10A-10C** show the barrel coupling **34** of FIG. **5** in more detail. The barrel coupling **34** includes an opening **70** extending through it for receiving the barrel **12** of a firearm. In the particular example shown, the opening **70** includes a recessed area **72** that partially or entirely receives a ridge on the barrel **12** such that the barrel coupling **34** can be slid over the barrel **12** and receive the barrel ridge in the recessed area **72** such that the reference surface **28** (e.g. a rear surface of the barrel ridge) is flush with or slightly proud of the end of barrel coupling **34** (see FIG. **11**). Recessed area **72** can also be seen in FIGS. **5C-5E**. Returning to FIGS. **10A-10C**, the barrel coupling **34** includes fastener openings **74** for receiving fasteners to further secure the barrel coupling in position on the barrel **12**.

[0059] The barrel coupling **34** further includes several locking element receivers **76** spaced apart from one another and configured and located to receive portions of locking elements **38** during use. In the particular example shown, the locking element receivers **76** are depressions in the outer surface of the barrel coupling **34**. In the particular example shown, the spaced apart locking elements **38** and locking element receivers **76** help to resist rotation or the movement or forces of the upper receiver coupling **32** relative to the barrel coupling **34** when the components are locked together.

[0060] The barrel coupling **34** further includes threads **78** on a portion of its outer surface. Threads **78** are not shown in FIG. **10** but are shown in FIG. **11**. The pitch, thread angle, and other characteristics (e.g. major diameter, minor diameter) of the threads **78** of barrel coupling **34** are the same or substantially the same as the pitch, thread angle, and other characteristics of the threads **18** of upper receiver **10**. Because these thread characteristics are the same or substantially the same, barrel and/or handguard nuts or other connectors useable with the upper receiver threads **18** are also useable with the barrel coupling threads **78**, meaning that handguards and other components that were usable with the upper receiver **10** can still be used with the firearm after installation of the upper receiver coupling **32** and barrel coupling **34** without necessarily requiring modification of those components or additional adaptors.

[0061] FIG. **12** illustrates an example of a protective cap **82** for protecting the end of gas tube **26** (or a piston) when the firearm is disassembled.

Example Method of Installation

[0062] The following is one example of a method of installing the quick-take down coupling shown in FIGS. **5-12**.

[0063] The upper receiver coupling **32** may be installed onto the upper receiver **10** by threading the upper receiver coupling **32** onto the upper receiver threads **18** to a desired torque and such that one of the tunnels **54** of the upper receiver coupling **32** is adequately aligned with the opening **24** in upper receiver **10**. Set screws or other fasteners may be inserted into openings **50** in body **36** to further secure the upper receiver coupling **32** to the upper receiver threads **18**.

[0064] The barrel coupling **34** may be installed onto the barrel **12** by sliding the coupling **34** onto the barrel until the barrel ridge is partially or entirely received in recessed area **72**, with the

reference surface **28** of the barrel ridge coplanar or just proud of the end of barrel coupling **34** and barrel pin **30** adjacent or proximate the barrel coupling **34**. Set screws or other fasteners may be inserted into openings **74** in coupling **34** to further secure it to the barrel **12**.

[0065] A handguard and/or barrel nut (e.g. **80** in FIG. 5A) may be threaded onto the barrel coupling **34** (in some instances, this may be done prior to securing the barrel coupling **34** to barrel **12**). A gas tube (e.g. **26** in FIG. 5A) or piston may be installed on barrel **12**, with an end of the gas tube or piston extending through an opening in the handguard/barrel nut **80**, and a handguard (e.g. **14** in FIG. 5A) may be installed onto the handguard/barrel nut **80**.

Example Method of Use

[0066] The following is one example of a method of using the quick-take down coupling shown in FIGS. 5-12 after installation onto a firearm.

[0067] Protective cap **82** may be removed from the end of gas tube **26** and barrel **12**.

[0068] Sliding lock collar **42** may be slid using a translational motion (e.g. non-rotational) back towards the upper receiver **10** to an unlocked position that releases the locking elements **38** inside of the upper receiver coupling **32**.

[0069] While the sliding lock collar **42** is held at the unlocked position, the barrel **12** may be inserted into the upper receiver **10**. The barrel **12** is inserted until the barrel reference surface **28** contacts the upper receiver contact surface **22**, with the barrel pin **30** seated in notch **20**. During insertion of the barrel, gas tube **26** (or a piston) is also inserted through one of the tunnels **54** in the upper receiver coupling **32** and into opening **24** in the upper receiver **10**. Once inserted, the locking element receivers **76** of the barrel coupling **34** are aligned with the locking elements **38** of the upper receiver coupling **32**.

[0070] Once inserted, the sliding lock collar **42** is released such that resilient element **40** forces the sliding lock collar **42** back to a locked position, causing the locking elements **38** to engage the locking element receivers **76**, securing the barrel **12** to the upper receiver **10**.

[0071] The barrel **12** may be removed from the upper receiver **10** using the same procedure in reverse.

Integrated Quick Take-Down Coupling

[0072] FIGS. 13 through 21 show examples of firearms with quick-take down couplings that have been integrated into the firearm when it is manufactured. In FIGS. 13-21, the upper receiver coupling **132** and the barrel coupling **134** are integral components of the firearm that are incorporated into the upper receiver **122** and barrel **112** at the time of manufacture. In other examples, both components are not integral. For example, a quick take-down firearm could include an upper receiver with a non-integral coupling component (such as shown in FIGS. 5-6) and a barrel with an integral coupling component (such as shown in FIGS. 13-14). In other examples, the barrel coupling component could be non-integral and the upper receiver coupling component could be integral.

[0073] FIG. 16 shows the components of the upper receiver coupling **132**. As with the upper receiver coupling **32** shown in FIG. 6, the upper receiver coupling **132** of FIG. 16 includes a body **136**, locking elements **138**, resilient element **140**, sliding lock collar **142**, and face plate **144**. The body **136** may be an integral part of the upper receiver **122** (e.g. machined, molded, forged, etc. from the same material and at the same time as the rest of the upper receiver). Alternatively, the body **136** may be secured to the upper receiver **122** in other ways, such as how the body **36** is secured to the upper receiver **12** in earlier examples.

[0074] FIGS. 17A and 17B show additional features of the body **136**. The body **136** includes a cavity with a stepped-down interior diameter having a larger interior diameter portion **202** that receives the coupling **134** of the barrel **112** and a smaller diameter portion **204** that receives an end of barrel **112**. At the shoulder **206** where the cavity steps down in diameter there is an alignment protrusion receiver **208** (e.g. a notch) that receives an alignment protrusion (e.g. a pin) of the barrel **112**, which is discussed further below. At the shoulder **206**, there is also an opening **210** for

receiving an anti-rotation feature, which is also discussed further below. As shown in FIGS. 17A and 17B, the body 136 also includes a tunnel 154 extending through the body, configured to allow passage of a gas tube or piston associated with the barrel 112 into the upper receiver 122.

[0075] FIGS. 18 and 19 show additional features of the barrel 112. The barrel 112 includes a portion 302 configured for insertion into the smaller diameter portion of the body 204 connected to the upper receiver 122. The barrel 112 also has a larger diameter coupling portion 304 including at least one depression (FIG. 18 shows multiple depressions) for engaging the locking elements 138 of the upper receiver coupling. At a shoulder where the barrel extension 302 meets the coupling portion 304 there is an alignment pin 306 and a counter-rotation feature 308 that fit into the notch 208 and opening 210 respectively in the body 136 of the upper receiver coupling, which properly align the barrel 112 to the upper receiver 122 (both rotationally and insertion depth) when assembled. The barrel also includes external threading 310 for securing a handguard to the barrel (e.g. as shown in FIGS. 20 and 21). In some embodiments, the external threading 310 is MILSPEC or other standardized threading allowing it to be used with standard barrel nuts or other threaded components for attaching a handguard to the barrel. As shown in FIG. 19, the barrel includes lugs 312 that interact with the lugs on the bolt when a round is chambered.

Barrel Extension With Quick Take-Down Coupling

[0076] FIGS. 22 and 23 show examples of barrels that have barrel extensions 402, in which the barrel extension 402 includes a quick take-down coupling 404.

[0077] In FIG. 22, the barrel extension 402 includes, from left to right, a cylindrical insertion surface 406 for insertion into the firearm's upper receiver, an alignment protrusion 408 (e.g. alignment pin) that fits into a notch of the upper receiver to rotationally align (and prevent rotation of) the barrel relative to the upper receiver, a reference surface 410 (e.g. a shoulder) limiting the insertion depth of the barrel into the upper receiver, the quick take-down coupling portion 404 of the barrel extension (including depressions 412) for engaging the locking elements of the quick take-down coupling of the upper receiver, and external threading 414 for securing a handguard. As also shown in FIG. 22, the barrel includes an elongated barrel portion 416 that secures to the barrel extension 402 by threading 418.

[0078] FIG. 23 shows an example of a barrel extension 402 and part of an elongated barrel 416 in cross section. As shown in FIG. 23, internal features of the barrel extension 402 include lugs 420 for interacting with the lugs of a bolt when a round is chambered, and internal threading 422 for engaging the threading 418 on the elongated barrel. FIG. 23 also shows internal features of the elongated barrel 416 including the chamber 424 for receiving a round of ammunition and the bore 426 of the barrel.

[0079] FIGS. 24-28B show an embodiment of a quick detach facility for a firearm 500. More particularly, the quick detach facility for a firearm that can be used with the firearm of FIGS. 1-4 to provide quick and easy installation and removal of the barrel 12 from the upper receiver/frame 10. The quick detach facility of FIGS. 24-28B includes an upper receiver coupling/first connection assembly 532 associated with the upper receiver/frame 10 and a second connection assembly 502 associated with the barrel 12. The second connection assembly includes a barrel coupling 534, shim 504, and inner ring 506. The upper receiver coupling 532 secures to the threads 18 of the upper receiver. The barrel coupling 534 secures to the barrel 12 proximate the reference surface 28 and pin 30. The quick detach facility has a locking/mating mechanism, described in further detail below, for locking and unlocking the upper receiver coupling 532 from the barrel coupling 534, providing for quick and easy installation and removal of the barrel 12 from the upper receiver 10. Thus, the first and second connection assemblies are selectively matable with each other and have a mating mechanism movable between a released position in which the first and second connection assemblies are separable from each other and a locked position in which the first and second connection assemblies are secured to each other for firearm operation.

[0080] The barrel 12 includes a central bore 524 that defines a forward rifled portion 526, a

rearward chamber portion **528**, and a barrel axis **530**.

[0081] The upper receiver coupling **532** includes, from left to right, a body **536**, latch/locking elements **538**, shim **508**, resilient element **540**, sliding/movable lock collar **542**, face plate **544**, and screws **510**. The resilient element **540** is shown in FIG. **24** as a wave spring, although other types of resilient elements may be used, such as a coil spring. The screws releasably secure the face plate to the body.

[0082] The body **536** includes an opening **546** extending through it from one end to the other. At least a portion of the opening **546** includes interior threading **548** (see FIGS. **27B** & **28B**), which is configured to engage the exterior threading **18** of the upper receiver **10**. In other words, the pitch, thread angle, major diameter, minor diameter, etc. of the threading **548** of the body **536** is configured to correspond with the pitch, thread angle, major diameter, minor diameter, etc. of the threading **18** of the upper receiver **10**. In some embodiments, the body threading **548** is MILSPEC or other standardized threading allowing it to be installed on a wide variety of commercially available firearms. The body **536** of also includes through holes **550** around the perimeter of the body **36** for receiving set screws or similar items to further secure the upper receiver coupling **532** to the upper receiver threads **18**. In some embodiments, the set screws used may be nylon or another relatively soft material to lessen the risk of damaging the upper receiver threads **18**.

[0083] The body **536** further includes latch passages/apertures **552** spaced around the body **536** each configured to receive latch/locking elements **538** (e.g. ball bearings) such that portions of the locking elements may protrude into the opening **546** of the body **536** when the upper receiver coupling **532** is in a locked configuration (discussed further below). As shown in FIGS. **27B** & **28B**, the apertures taper so that, in cooperation with the shape of the locking elements **538**, the amount of penetration of the locking elements **538** into the opening **546** is limited.

[0084] The body **536** further includes several tunnels **554** extending through the length of the body from one end to the other. The tunnels **554** are configured to allow passage of a gas tube or piston associated with the barrel **12** through the body **536** and into the opening **24** on the upper receiver. As shown in FIG. **24**, the tunnels **554** are rotationally offset from one another (in this example, there are two tunnels **554** spaced apart 180 degrees from each other) and also rotationally offset from the apertures **552** in the body **536**. In this example, the tunnels **554** are rotationally offset to allow for proper alignment of one of the tunnels **554** with the opening **24** in the upper receiver **10** when the upper receiver coupling **532** is secured to the upper receiver threads **18** at a desired torque or within a desired torque range.

[0085] In other embodiments, tunnels are not necessary. For example, in some embodiments, the quick detach facility may be used with an AR Pistol or other firearm that uses direct blowback cycling, without the need for a gas tube or piston.

[0086] The body **536** further includes a flange or shoulder **556** and openings **558**, the purposes of which will be described further below. A shim **508** abuts the shoulder **556**.

[0087] The sliding lock collar **542** of FIG. **24** has an opening extending through it with an innermost internal diameter of sufficient dimension to allow the collar **542** to fit over a portion of the body **536** in a sliding fashion. The collar **542** may be slid in a translational motion along the body **536** (e.g. straight along the body **536** without rotation of the collar **542** relative to the body **536**).

[0088] The opening of collar **542** includes a recessed area terminating at shoulder **560** at one end of the collar **542**. The recess is configured to contain the resilient element **540**, with one end of the element **540** acting against shoulder **556** and the other end of the element **540** acting against shoulder **560** such that collar **542** is biased away from the shoulder **556** of body **536** towards the other end of the body **536**.

[0089] The opening of collar **542** also includes a second recess at the other end of the collar **542**. In this particular example, the second recess is formed by tapered inner surface/ramped surface **562** adapted to bear on the locking elements **538**. When the collar **542** is biased away from the shoulder

556 of body 536, the ramped surface 562 acts on locking elements 538 to cause those elements to protrude into the openings 546 of body 536 (see FIGS. 27A & 27B) in a locked position. When the collar 542 is pulled back against the bias of resilient element 540 into a retracted, the locking elements 538 are unlocked and can move out of the opening 546 (see FIGS. 28A & 28B) away from the barrel axis 530 to enable the mating mechanism to move to the released position.

[0090] The face plate 544 includes a central opening 564 and tunnel portions 566 corresponding to the opening 546 and tunnels 554 of body 536. The outer diameter of the face plate 544 is of sufficient size so that when it is secured to the end of body 536 (e.g. using fasteners/screws 510 passing through fastener openings 568 in face plate 544 and into openings 558 in body 536), the face plate 544 limits the sliding movement of collar 542 away from the shoulder 556 of body 536.

[0091] The outer ring/barrel coupling 534 includes an opening 570 extending through it for receiving the barrel 12 of a firearm. In the particular example shown, the opening 570 includes a recessed area 572 (shown in FIGS. 25, 27B & 28B) that partially or entirely receives a barrel ridge 512 on the barrel 12 such that the barrel coupling 534 can be slid over the barrel 12 and receive the barrel ridge in the recessed area 572 such that the reference surface 28 (e.g. a rear surface of the barrel ridge) is flush with or slightly proud of the end of barrel coupling 534 (see FIGS. 27B & 28B). A shim 504 is captured in the recessed area 572 between the barrel ridge and the barrel coupling. The barrel coupling 534 includes fastener openings 574 for receiving fasteners to further secure the barrel coupling in position on the barrel 12.

[0092] The barrel coupling 534 further includes several latch receptacles/locking element receivers 576 spaced apart from one another and configured and located to receive portions of locking elements 538 during use. In the particular example shown, the locking element receivers 576 are spherical depressions in the outer surface 514 of the barrel coupling 534. In the particular example shown, the spaced apart locking elements 538 and locking element receivers 576 help to resist rotation or the movement or forces of the upper receiver coupling 532 relative to the barrel coupling 534 when the components are locked together.

[0093] The barrel coupling 534 further includes threads 578 on a portion of its outer surface 514. The pitch, thread angle, and other characteristics (e.g. major diameter, minor diameter) of the threads 578 of barrel coupling 534 are the same or substantially the same as the pitch, thread angle, and other characteristics of the threads 18 of upper receiver 10. Because these thread characteristics are the same or substantially the same, barrel and/or handguard nuts or other connectors useable with the upper receiver threads 18 are also useable with the barrel coupling threads 578, meaning that handguards and other components that were usable with the upper receiver 10 can still be used with the firearm after installation of the upper receiver coupling 532 and barrel coupling 534 without necessarily requiring modification of those components or additional adaptors.

[0094] A forward portion of the opening 570 in the barrel coupling 574 defines a tapered inner surface 516 configured to closely receive the tapered outer surface 518 of the inner ring 506. The inner ring 506 has a cylindrical inner surface 520 configured to closely contact a selected portion of the barrel 12. The inner ring is a split ring having a rearward-facing gap 522 adapted to accommodate a range of barrel diameters. The tapered outer surface 518 of the inner ring 506 is a conical surface. In the current embodiment, the tapered outer surface 518 of the inner ring 506 has a taper angle offset from the barrel axis 530 of at least 1° and at most 20°. For an expected best preferred range of performance for AR-15, AR Pistols, M4, M16 and similar prior art MILSPEC firearm platforms, the tapered outer surface 518 of the inner ring 506 has a taper angle offset from the barrel axis 530 of between 1° and 10°. The tapered outer surface 518 of the inner ring 506 and the tapered inner surface 516 of the barrel coupling 534 have a common shape such that they have an extensive surface of contact. The tapered outer surface 518 of the inner ring 506 and the tapered inner surface 516 of the barrel coupling 534 have a common taper angle. The barrel coupling 534 has a rear shoulder surface 580 configured to bear against the barrel ridge/barrel shoulder 512, and the inner ring 506 has a forward bearing surface 582 configured for application of a rearward axial

assembly force to advance the inner ring **506** into the space defined between the inner tapered surface **516** of the barrel coupling **534** and the outer surface **584** of the barrel **12**. As is denoted by the force arrows in FIGS. **27B** & **28B**, as the inner ring **506** pushes rearward on the barrel coupling **534** during installation of the barrel coupling on the barrel **12**, an opposing force results when the shim **504** is compressed between the barrel coupling **534** and the barrel ridge **512**. Thus, the barrel coupling **534** is in circumferential tension and applies an inward compressive force to the inner ring **506**. The interaction between the barrel coupling **534** and inner ring **506** enables better system tuning during installation of the barrel coupling **534** on the barrel **12** while allowing looser manufacturing tolerances. Furthermore, the interaction between the barrel coupling **534** and inner ring **506** prevents loosening of the barrel coupling's fit to the barrel **12** over time because of vibrations, temperatures, and deformation during assembly of the barrel coupling to the barrel **12**. [0095] In the current embodiment, the tapered outer surface **518** of the inner ring **506** has a self-holding taper angle. For the purposes of the specification, "self-holding" is defined as smaller tapers, like the Morse and the Brown & Sharpe, because, where the angle of the taper is only 2 or 3°, the shank of a tool is so firmly seated in its socket that there is considerable frictional resistance to any force tending to turn or rotate the tool relative to the socket. Thus, a positive locking device is not required to prevent slipping, which makes the use of set screws optional.

Example Method of Installation

[0096] The following is one example of a method of installing the quick detach facility shown in FIGS. **24-28B**.

[0097] The upper receiver coupling **532** may be installed onto the upper receiver **10** by threading the upper receiver coupling **532** onto the upper receiver threads **18** to a desired torque and such that one of the tunnels **554** of the upper receiver coupling **532** is adequately aligned with the opening **24** in upper receiver **10**. Set screws or other fasteners may be inserted into openings **550** in body **536** to further secure the upper receiver coupling **532** to the upper receiver threads **18**.

[0098] The shim **504**, inner ring **506**, and barrel coupling **534** may be installed onto the barrel **12** by sliding the shim **504**, barrel coupling **534**, and inner ring **506** onto the barrel until the barrel ridge **512** is partially or entirely received in recessed area **572**, with the reference surface **28** of the barrel ridge coplanar or just proud of the end of barrel coupling **354** and barrel pin **30** adjacent or proximate the barrel coupling **534**. The shim **504** is captured in the recessed area **572** between the barrel ridge **512** and the barrel coupling **534**. A tooling ring can be used to exert rearward pressure on the forward bearing surface **582** of the inner ring **506** to securely seat the inner ring **506** within the barrel coupling **534**. Set screws or other fasteners may be inserted into openings **574** in barrel coupling **534** to further secure it to the barrel **12**.

[0099] A handguard and/or barrel nut (e.g. **80** in FIG. **5A**) may be threaded onto the barrel coupling **534** (in some instances, this may be done prior to securing the barrel coupling **534** to barrel **12**). A gas tube (e.g. **26** in FIG. **5A**) or piston may be installed on barrel **12**, with an end of the gas tube or piston extending through an opening in the handguard/barrel nut **80**, and a handguard (e.g. **14** in FIG. **5A**) may be installed onto the handguard/barrel nut **80**.

Example Method of Use

[0100] The following is one example of a method of using the quick detach facility shown in FIGS. **24-28B** after installation onto a firearm.

[0101] Sliding lock collar **542** may be slid using a translational motion (e.g. non-rotational) back towards the upper receiver **10** to an unlocked position shown in FIGS. **28A** & **28B** that releases the locking elements **538** inside of the upper receiver coupling **532**.

[0102] While the sliding lock collar **542** is held at the unlocked position, the barrel **12** may be inserted into the upper receiver **10**. The barrel **12** is inserted until the barrel reference surface **28** contacts the upper receiver contact surface **22**, with the barrel pin **30** seated in notch **20**. During insertion of the barrel, gas tube **26** (or a piston) is also inserted through one of the tunnels **554** in the upper receiver coupling **532** and into opening **24** in the upper receiver **10**. Once inserted, the

locking element receivers 576 of the barrel coupling 534 are aligned with the locking elements 538 of the upper receiver coupling 532.

[0103] Once inserted, the sliding lock collar 542 is released such that resilient element 540 forces the sliding lock collar 542 back to a locked position shown in FIGS. 27A & 27B, causing the locking elements 538 to engage the locking element receivers 576, securing the barrel 12 to the upper receiver 10 in the condition shown in FIGS. 27A & 27B.

[0104] The barrel 12 may be removed from the upper receiver 10 using the same procedure in reverse, resulting in the condition shown in FIGS. 28A & 28B where the barrel 12 is in the process of being disengaged and removed from the upper receiver 10.

[0105] In the context of the specification, the terms “rear” and “rearward,” and “front” and “forward,” have the following definitions: “rear” or “rearward” means in the direction away from the muzzle of the firearm while “front” or “forward” means it is in the direction towards the muzzle of the firearm.

[0106] The foregoing description is by way of example only and does not limit in any way the scope of the present invention, which is set forth in the following claims. Additions, deletions, substitutions, and other modifications to the systems and methods described above may be made without departing from the scope or spirit of the present invention. For example, it should be appreciated that the current invention is adaptable to other firearm platforms in addition to the AR-15, AR Pistols, M4, M16 and similar prior art MILSPEC rifles previously described. The current invention is suitable for use with bolt action rifles, lever action rifles, revolvers, and self-loading pistols. The current invention can be used with any caliber range, along with any fixed barrel firing system in any configuration.

Claims

1. A quick-detach barrel mounting facility for a firearm having a receiver and a barrel comprising: a barrel including a barrel coupling portion at a rear end of the barrel; a receiver coupling portion defining a central opening configured to receive the barrel coupling portion; the receiver coupling portion defining a plurality of apertures; the receiver coupling portion including a plurality of locking elements, each locking element received in one of the plurality of apertures and operable to reciprocate in the aperture between an engaged position protruding into the central opening and a disengaged position; the receiver coupling portion including a latch element connected to the first body and having a locking surface proximate each of the apertures and configured to contact each of the locking elements; the latch element being movable between an unlocked position in which the locking elements are enabled to move to the disengaged position and a locked position in which the locking elements are retained in the engaged position; and the barrel coupling portion defining a depression configured for engagement by a locking element to secure the first body to the second body when the locking elements are in the engaged position, and to enable separation of the first body from the second body when the locking elements are in the disengaged position, such that the barrel is removable from the frame by moving the latch element to the unlocked position.
2. The quick-detach barrel mounting facility of claim 1 wherein the latch element is biased to the locked position.
3. The quick-detach barrel mounting facility of claim 1 wherein each locking element is a ball.
4. The quick-detach barrel mounting facility of claim 1 wherein each aperture has a conical shape.
5. The quick-detach barrel mounting facility of claim 1 wherein each aperture has a tapered shape.
6. The quick-detach barrel mounting facility of claim 1 wherein the barrel defines a barrel axis, and wherein each aperture extends radially away from the barrel axis.
7. The quick-detach barrel mounting facility of claim 1 wherein each aperture is adapted to closely fit the associated locking element when the locking element is in the engaged position.
8. The quick-detach barrel mounting facility of claim 1 wherein the latch element is a ring

encompassing the first body.

9. The quick-detach barrel mounting facility of claim 8 wherein the ring has a tapered interior surface.

10. The quick-detach barrel mounting facility of claim 9 wherein the barrel defines a barrel axis and the tapered interior surface is angularly offset from the barrel axis.

11. The quick-detach barrel mounting facility of claim 1 wherein the apertures are configured to closely fit the locking elements.

12. The quick-detach barrel mounting facility of claim 1 wherein the receiver coupling portion defines a cylindrical bore and the barrel coupling portion includes a cylindrical protrusion sized to be closely received in the cylindrical bore.

13. The quick-detach barrel mounting facility of claim 12 wherein the cylindrical protrusion has a peripheral cylindrical surface and wherein the depression is defined in the peripheral cylindrical surface.

14. The quick-detach barrel mounting facility of claim 1 wherein the receiver defines a plurality of gas tube apertures, each configured to receive a gas tube.

15. The quick-detach barrel mounting facility of claim 1 wherein the latch element is a ring having a ramped interior surface operably contacting the lock elements.

16. The quick-detach barrel mounting facility of claim 1 wherein the depression includes an outward and forward-facing angled surface configured to contact the locking element.

17. The quick-detach barrel mounting facility of claim 1 wherein the barrel coupling includes a depression zone encircling the barrel coupling portion.

18. The quick-detach barrel mounting facility of claim 17 wherein the depression zone is configured to be operably engaged by the plurality of locking elements.

19. The quick-detach barrel mounting facility of claim 17 wherein the depression zone includes a plurality of separate depressions separated by raised areas, such that rotation of the barrel is prevented.

20. The quick-detach barrel mounting facility of claim 1 including a locking element receiver region encircling the barrel coupling portion.

21. The quick-detach barrel mounting facility of claim 1 wherein the barrel coupling portion has a cylindrical rear outer surface portion rearward of the depression and configured to be closely received in the receiver coupling central opening rearward of the locking elements, and to prevent extraction of the barrel from the receiver when the locking elements are in the engaged position.
