HLA CLASS II-RESTRICTED T CELL RECEPTORS AGAINST MUTATED RAS

Abstract

Disclosed is an isolated or purified T cell receptor (TCR), wherein the TCR has antigenic specificity for mutated Kirsten rat sarcoma viral oncogene homolog (KRAS) presented by a human leukocyte antigen (HLA) Class II molecule. Related polypeptides and proteins, as well as related nucleic acids, recombinant expression vectors, host cells, populations of cells, and pharmaceutical compositions are also provided. Also disclosed are methods of detecting the presence of cancer in a mammal and methods of treating or preventing cancer in a mammal.

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS [0001] This patent application is a divisional of U.S. patent application Ser. No. 17/692,787, filed Mar. 11, 2022, which is a divisional of U.S. patent application Ser. No. 16/135,231, filed Sep. 19, 2018, now U.S. Pat. No. 11,306,132, which claims the benefit of U.S. Provisional Patent Application No. 62/560,930, filed Sep. 20, 2017, each of which is incorporated by reference herein in its entirety.

INCORPORATION-BY-REFERENCE OF MATERIAL SUBMITTED ELECTRONICALLY [0003] Incorporated by reference in its entirety herein is a computer-readable nucleotide/amino acid sequence listing submitted concurrently herewith and identified as follows: One 66,360 Byte Extensible Markup Language (XML) file named “772937_ST26.xml,” dated Apr. 22, 2025.

BACKGROUND OF THE INVENTION

[0004] Some cancers may have very limited treatment options, particularly when the cancer becomes metastatic and unresectable. Despite advances in treatments such as, for example, surgery, chemotherapy, and radiation therapy, the prognosis for many cancers, such as, for example, pancreatic, colorectal, lung, endometrial, ovarian, and prostate cancers, may be poor. Accordingly, there exists an unmet need for additional treatments for cancer.

BRIEF SUMMARY OF THE INVENTION

[0005] An embodiment of the invention provides an isolated or purified T-cell receptor (TCR), wherein the TCR has antigenic specificity for a mutated human Ras amino acid sequence presented by a human leukocyte antigen (HLA) Class II molecule, wherein the mutated human RAS amino acid sequence is a mutated human Kirsten rat sarcoma viral oncogene homolog (KRAS), a mutated human Harvey rat sarcoma viral oncogene homolog (HRAS), or a mutated human Neuroblastoma rat sarcoma viral oncogene homolog (NRAS) amino acid sequence.

[0006] Another embodiment of the invention provides an isolated or purified polypeptide comprising a functional portion of the inventive TCR, wherein the functional portion comprises the amino acid sequences of: (a) all of SEQ ID NOs: 1-3, (b) all of SEQ ID NOs: 4-6, (c) all of SEQ ID NOs: 7-9, (d) all of SEQ ID NOs: 10-12, (e) all of SEQ ID NOs: 1-6, or (f) all of SEQ ID NOs: 7-12.

[0007] Still another embodiment of the invention provides an isolated or purified protein comprising at least one of the inventive polypeptides.

[0008] Embodiments of the invention further provide nucleic acids, recombinant expression vectors, host cells, populations of cells, and pharmaceutical compositions relating to the inventive TCRs, polypeptides, and proteins.

[0009] Methods of detecting the presence of cancer in a mammal and methods of treating or preventing cancer in a mammal are further provided by embodiments of the invention.

Description

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING(S)

[0010] FIG. 1 depicts experimental data (dot plots) illustrating the detection of cells stained for isotype (control) or cells stained for PD-1 and/or OX40 expression by flow cytometry. The numbers in the histograms represent the percentage of cells expressing PD-1.

[0011] FIG. 2 is a graph showing the number of interferon gamma (IFN γ) positive spots per well detected upon co-culture of pooled cultures of effector autologous T cells (culture numbers W1-W16) with target DCs pulsed with the indicated pools of 25-mer peptides (PP) or pools of peptide encoded by 25-mer tandem minigenes (TMGs) encompassing various tumor-specific mutations. Autologous T cells cultured alone, with dimethyl sulfoxide (DMSO), or OKT3 antibody served as controls. The boxed symbol (\emptyset) indicates the pooled cultures (7 and 8) from which the TCR was isolated.

[0012] FIG. 3 is a graph showing the number of IFN γ positive spots per 2×10^4 (2E4) cells detected upon co-culture of autologous T cells of culture number 7 (W7) with autologous DCs pulsed with each of peptides 1-17 (P1-P17) from peptide pool 1 (PP1). Autologous T cells cultured with dimethyl sulfoxide (DMSO) or OKT3 antibody served as controls.

[0013] FIG. 4 is a graph showing the percentage of effector T cells transduced with the TCR of Example 2 which expressed 4-1BB upon co-culture with target autologous APCs pulsed with a KRAS G12V peptide (1 ng/mL) in the presence of HLA-blocking antibody W6/32 (anti-HLA-A, —B, —C), IVA12 (pan-specific, anti-HLA Class II), B7/21 (anti-HLA-DP), HB55 (anti-HLA-DR), or SPV-L3 (HLA-DQ) (target cell). Effector transduced cells cultured alone, with DMSO, or phorbol myristate acetate (PMA) served as controls. Effector cells transduced with an empty vector (mock) co-cultured with target autologous APCs pulsed with 1 ng/mL KRAS G12V peptide served as still another control.

[0014] FIG. 5 is a graph showing the (i) number of IFN- γ per 2×10^4 cells measured by ELISPOT and (ii) the percentage of mTCR β +CD8+4-1BB+ cells measured by flow cytometry upon co-culture of T cells transduced with the TCR of Example 2 with autologous APCs (4148 MB) or APCs from donors with a DRB1 01:01 or DRB1 07:01 haplotype pulsed with a KRAS.sup.G12V peptide or WT KRAS peptide. Effector cells were co-cultured with APCs from a HLA-DRB1 positive donor (“DRB mismatch”) as a control. Effector cells cultured alone, with DMSO, or with phorbol myristate acetate-ionomycin (PMA:Iono) served as further controls.

[0015] FIG. 6 is a graph showing the (i) number of IFN- γ per 2×10^4 cells measured by ELISPOT (hatched bars) and (ii) the percentage of cells expressing 4-1BB and/or OX40 measured by flow cytometry (black bars) upon co-culture of T cells transduced with the TCR of Example 2 with autologous DCs pulsed with cell lysates of tumor cell lines expressing one of the following KRAS G12 mutations: G12R, G12C, G12D, or G12V. Transduced cells co-cultured with autologous DCs pulsed with the cell lysate of a tumor cell line which expresses WT KRAS served as a control. Transduced cells cultured alone or with PMA or DMSO served as further controls.

[0016] FIG. 7 is a graph showing the percentage of mTCR β +CD8+4-1BB+ cells measured by flow cytometry upon co-culture of T cells transduced with the TCR of Example 2 co-cultured overnight with autologous DCs pulsed with a KRAS.sup.G12V peptide (triangles) or WT KRAS peptide (squares) in the concentrations indicated.

[0017] FIG. 8 is a graph showing the number of IFN- γ per 2×10^4 cells measured by ELISPOT upon co-culture of T cells transduced with the TCR of Example 2 with autologous DCs pulsed with the peptides of Table 9 in the indicated concentrations.

[0018] FIG. 9 depicts experimental data (dot plots) illustrating the percentage of cells expressing a murine TCR beta chain and 4-1BB following co-culture of cells transduced with a MSGV-1-retrovirus encoding the KRAS.sup.G12C TCR with DMSO (control) or DCs loaded with the

indicated WT KRAS or KRAS.sup.G12C peptide at the indicated concentrations. The dot plots indicate the percentages of cells which are: mTCR β +/-4-1BB- (upper left quadrant (Q1)); mTCR β +/-4-1BB+ (upper right quadrant (Q2)); mTCR β -/-4-1BB+ (lower right quadrant (Q3)); mTCR β -/-4-1BB- (lower left quadrant (Q4)), as follows (percentages in parentheses): DMSO: Q1 (71.0), Q2 (0.96), Q3 (0.20), Q4 (27.9). WT 10 μ g/ml: Q1 (64.5), Q2 (4.27), Q3 (0.43), Q4 (30.8). WT 1 μ g/ml: Q1 (70.6), Q2 (1.13), Q3 (0.20), Q4 (28.1). G12C 10 μ g/ml: Q1 (13.6), Q2 (51.7), Q3 (1.61), Q4 (33.0). G12C 1 μ g/ml: Q1 (19.7), Q2 (46.9), Q3 (1.67), Q4 (31.7).

[0019] FIG. 10 is a graph showing the percentage of cells expressing CD3 and 4-1BB following co-culture of T cells transduced with the KRAS.sup.G12C TCR with autologous DCs or allogeneic DCs matching with single HLA-DRB15:01 or HLA-DRB11:01 alleles pulsed with the KRAS.sup.G12C 24-mer peptide following blocking of their membrane MHC-II molecules using antibodies against HLA-DQ, DR, DP, or an antibody against all of HLA-DQ, DR, and DP. Transduced cells co-cultured with DCs pulsed with WT KRAS peptide served as a control. Transduced cells co-cultured with PMA/ion served as a further control.

DETAILED DESCRIPTION OF THE INVENTION

[0020] RAS family proteins belong to the large family of small GTPases. Without being bound to a particular theory or mechanism, it is believed that, when mutated, RAS proteins may be involved in signal transduction early in the oncogenesis of many human cancers. A single amino acid substitution may activate the protein. The mutated RAS protein product may be constitutively activated. Mutated RAS proteins may be expressed in any of a variety of human cancers such as, for example, pancreatic (e.g., pancreatic carcinoma), colorectal, lung (e.g., lung adenocarcinoma), endometrial, ovarian (e.g., epithelial ovarian cancer), and prostate cancers. The human RAS family proteins include Kirsten rat sarcoma viral oncogene homolog (KRAS), Harvey rat sarcoma viral oncogene homolog (HRAS), and Neuroblastoma rat sarcoma viral oncogene homolog (NRAS).

[0021] KRAS is also referred to as GTPase KRas, V-Ki-Ras2 Kirsten rat sarcoma viral oncogene, or KRAS2. There are two transcript variants of KRAS: KRAS variant A and KRAS variant B. Wild-type (WT) KRAS variant A has the amino acid sequence of SEQ ID NO: 17. Wild-type (WT) KRAS variant B has the amino acid sequence of SEQ ID NO: 18. Hereinafter, references to "KRAS" (mutated or unmutated (WT)) refer to both variant A and variant B, unless specified otherwise. When activated, mutated KRAS binds to guanosine-5'-triphosphate (GTP) and converts GTP to guanosine 5'-diphosphate (GDP).

[0022] HRAS is another member of the RAS protein family. HRAS is also referred to as Harvey Rat Sarcoma Viral Oncoprotein, V-Ha-Ras Harvey Rat Sarcoma Viral Oncogene Homolog, or Ras Family Small GTP Binding Protein H-Ras. WT HRAS has the amino acid sequence of SEQ ID NO: 19.

[0023] NRAS is still another member of the RAS protein family. NRAS is also referred to as GTPase NRas, V-Ras Neuroblastoma RAS Viral Oncogene Homolog, or NRAS1. WT NRAS has the amino acid sequence of SEQ ID NO: 20.

[0024] An embodiment of the invention provides an isolated or purified TCR having antigenic specificity for a mutated human RAS amino acid sequence (hereinafter, "mutated RAS") presented by a human leukocyte antigen (HLA) Class II molecule, wherein the mutated human RAS amino acid sequence is a mutated human KRAS, a mutated human HRAS, or a mutated human NRAS amino acid sequence. Hereinafter, references to a "TCR" also refer to functional portions and functional variants of the TCR, unless specified otherwise.

[0025] The inventive TCR may have antigenic specificity for any mutated human RAS protein, polypeptide or peptide amino acid sequence. In an embodiment of the invention, the mutated human RAS amino acid sequence is a mutated human KRAS amino acid sequence, a mutated human HRAS amino acid sequence, or a mutated human NRAS amino acid sequence. The amino acid sequences of WT human KRAS, NRAS, and HRAS protein each have a length of 188-189 amino acid residues and have a high degree of identity to one another. For example, the amino acid

sequence of the WT human NRAS protein is 86.8% identical to that of the WT human KRAS protein. Amino acid residues 1-86 of the WT human NRAS protein and the WT human KRAS protein are 100% identical. The amino acid sequence of the WT human HRAS protein is 86.3% identical to that of the WT human KRAS protein. Amino acid residues 1-94 of the WT human HRAS protein and the WT human KRAS protein are 100% identical. Hereinafter, references to “RAS” (mutated or unmutated (WT)) collectively refer to KRAS, HRAS, and NRAS, unless specified otherwise.

[0026] In an embodiment of the invention, the mutated human RAS amino acid sequence comprises a WT RAS amino acid sequence with a substitution of glycine at position 12, wherein position 12 is defined by reference to the WT RAS protein, respectively. The WT RAS protein may be any of WT KRAS protein (SEQ ID NO: 17 or 18), WT HRAS protein (SEQ ID NO: 19), or WT NRAS protein (SEQ ID NO: 20) because, as explained above, amino acid residues 1-86 of the WT human NRAS protein and the WT human KRAS protein are 100% identical, and amino acid residues 1-94 of the WT human HRAS protein and the WT human KRAS protein are 100% identical. Accordingly, the amino acid residue at position 12 of each of WT KRAS, WT HRAS, and WT NRAS protein is the same, namely, glycine.

[0027] The glycine at position 12 of the WT RAS amino acid sequence may be substituted with any amino acid residue other than glycine. In an embodiment of the invention, the substitution is a substitution of glycine at position 12 of the WT RAS amino acid sequence with valine or cysteine. In this regard, embodiments of the invention provide TCRs with antigenic specificity for any WT RAS protein, polypeptide or peptide amino acid sequence with a G12V mutation or a G12C mutation.

[0028] Mutations and substitutions of RAS are defined herein by reference to the amino acid sequence of WT RAS protein. Thus, mutations and substitutions of RAS are described herein by reference to the amino acid residue present at a particular position in WT RAS protein, followed by the position number, followed by the amino acid residue with which that residue has been replaced in the particular mutation or substitution under discussion. A RAS amino acid sequence (e.g., a RAS peptide) may comprise fewer than all of the amino acid residues of the full-length, WT RAS protein. Accordingly, position 12 is defined herein by reference to the WT full-length RAS protein (namely, any one of SEQ ID NOs: 17-20) with the understanding that the actual position of the corresponding residue in a particular example of a RAS amino acid sequence may be different. When the positions are as defined by any one of SEQ ID NOs: 17-20, the term “G12” refers to the glycine normally present at position 12 of any one of SEQ ID NOs: 17-20, and “G12V” indicates that the glycine normally present at position 12 of any one of SEQ ID NOs: 17-20 is replaced by a valine. For example, when a particular example of a RAS amino acid sequence is, e.g., TEYKLVVVGAGGVGKSALTIQLI (SEQ ID NO: 29) (an exemplary WT KRAS peptide corresponding to contiguous amino acid residues 2 to 24 of SEQ ID NO: 17), “G12V” refers to a substitution of the underlined glycine in SEQ ID NO: 29 with valine, even though the actual position of the underlined glycine in SEQ ID NO: 29 is 11.

[0029] Examples of full-length RAS proteins with the G12V or G12C mutation are set forth in Table 1 below.

TABLE-US-00001 TABLE 1 SEQ ID Mutated Full-Length RAS Protein NO: G12V KRAS variant A 21 G12V KRAS variant B 22 G12V HRAS 23 G12V NRAS 24 G12C KRAS variant A 25 G12C KRAS variant B 26 G12C HRAS 27 G12C NRAS 28

[0030] In an embodiment of the invention, the TCR has antigenic specificity for a RAS peptide with the G12V mutation or G12C mutation described above, wherein the mutated RAS peptide has any length. In an embodiment of the invention, the mutated RAS peptide has any length suitable for binding to any of the HLA Class II molecules described herein. For example, the TCR may have antigenic specificity for a RAS peptide with the G12V mutation or G12C mutation, the RAS peptide having a length of about 11 to about 30 amino acid residues, about 12 to about 24 amino

acid residues, or about 18 to about 20 amino acid residues. The mutated RAS peptide may comprise any contiguous amino acid residues of mutated RAS protein which include the G12V or G12C mutation. In an embodiment of the invention, the TCR may have antigenic specificity for a RAS peptide with the G12V mutation or G12C mutation, the mutated RAS peptide having a length of about 30 amino acid residues, about 29 amino acid residues, about 28 amino acid residues, about 27 amino acid residues, about 26 amino acid residues, about 25 amino acid residues, about 24 amino acid residues, about 23 amino acid residues, about 22 amino acid residues, about 21 amino acid residues, about 20 amino acid residues, about 19 amino acid residues, about 18 amino acid residues, about 17 amino acid residues, about 16 amino acid residues, about 15 amino acid residues, about 14 amino acid residues, about 13 amino acid residues, about 12 amino acid residues, about 11 amino acid residues, or a range of any two of the foregoing values. Examples of specific peptides, each with the G12V mutation, which may be recognized by the inventive G12V TCR are set forth in Table 9.

[0031] In an embodiment of the invention, the inventive TCRs are able to recognize mutated RAS presented by an HLA Class II molecule. In this regard, the TCR may elicit an immune response upon binding to mutated RAS within the context of an HLA Class II molecule. The inventive TCRs are able to recognize mutated RAS that is presented by an HLA Class II molecule and may bind to the HLA Class II molecule in addition to mutated RAS.

[0032] In an embodiment of the invention, the HLA Class II molecule is an HLA-DR molecule. The HLA-DR molecule is a heterodimer of an α chain and a β chain. The HLA-DR β chain may be encoded by the HLA-DRA gene. The HLA-DR α chain may be encoded by the HLA-DRB1 gene, the HLA-DRB3 gene, HLA-DRB4 gene, or the HLA-DRB5 gene. The HLA-DR molecule may be any HLA-DR molecule. Examples of HLA-DR molecules may include, but are not limited to, HLA-DR1, HLA-DR2, HLA-DR3, HLA-DR4, HLA-DR5, HLA-DR6, HLA-DR7, HLA-DR8, HLA-DR9, HLA-DR10, HLA-DR11, HLA-DR12, HLA-DR13, HLA-DR14, HLA-DR15, and HLA-DR16. Preferably, the HLA-DR molecule is HLA-DR7 or HLA-DR11.

[0033] In an embodiment of the invention, the HLA Class II molecule is an HLA-DRB1 molecule. The HLA-DRB1 molecule may be any HLA-DRB1 molecule. Examples of HLA-DRB1 molecules may include, but are not limited to, HLA-DRB1*01:01, HLA-DRB1*01:02, HLA-DRB1*01:03, HLA-DRB1*03:01, HLA-DRB1*04:01, HLA-DRB1*04:02, HLA-DRB1*04:03, HLA-DRB1*04:04, HLA-DRB1*04:05, HLA-DRB1*04:07, HLA-DRB1*07:01, HLA-DRB1*08:01, HLA-DRB1*08:03, HLA-DRB1*09:01, HLA-DRB1*10:01, HLA-DRB1*11:01, HLA-DRB1*11:03, HLA-DRB1*11:04, HLA-DRB1*12:01, HLA-DRB1*13:01, HLA-DRB1*13:02, HLA-DRB1*13:03, HLA-DRB1*14:01, HLA-DRB1*15:01, HLA-DRB1*15:02, and HLA-DRB1*16:01. Preferably, the HLA Class II molecule is an HLA-DRB1*07:01 molecule or an HLA-DRB1*11:01 molecule.

[0034] The TCRs of the invention may provide any one or more of a variety of advantages, including when expressed by cells used for adoptive cell transfer. Mutated RAS is expressed by cancer cells and is not expressed by normal, noncancerous cells. Without being bound to a particular theory or mechanism, it is believed that the inventive TCRs advantageously target the destruction of cancer cells while minimizing or eliminating the destruction of normal, non-cancerous cells, thereby reducing, for example, by minimizing or eliminating, toxicity. Moreover, the inventive TCRs may, advantageously, successfully treat or prevent mutated RAS-positive cancers that do not respond to other types of treatment such as, for example, chemotherapy, surgery, or radiation. For example, the KRAS G12V mutation is expressed in about 27% and about 8% of patients with pancreatic and colorectal cancers, respectively, and the KRAS G12C mutation is expressed in about 15% of patients with lung cancer. Additionally, the inventive TCRs may provide highly avid recognition of mutated RAS, which may provide the ability to recognize unmanipulated tumor cells (e.g., tumor cells that have not been treated with interferon (IFN)- γ , transfected with a vector encoding one or both of mutated RAS and HLA-DRB1*07:01, one or

both of mutated RAS and HLA-DRB1*11:01, pulsed with a RAS peptide with the G12V mutation, pulsed with a RAS peptide with the G12C mutation, or a combination thereof). Moreover, the HLA-DRB1*07:01 and HLA-DRB1*11:01 alleles are expressed in about 25% and about 10.5%, respectively, of individuals with Caucasian ethnicity in the United States. Accordingly, the inventive TCRs may increase the number of immunotherapy-eligible cancer patients to include those patients that express one or both of the HLA-DRB1*07:01 and HLA-DRB1*11:01 alleles who may not be eligible for immunotherapy using TCRs that recognize RAS presented by other MHC molecules.

[0035] The phrase “antigenic specificity,” as used herein, means that the TCR can specifically bind to and immunologically recognize mutated RAS with high avidity. For example, a TCR may be considered to have “antigenic specificity” for mutated RAS if about 1×10^4 to about 1×10^5 T cells expressing the TCR secrete at least about 200 $\mu\text{g/mL}$ or more (e.g., 200 $\mu\text{g/mL}$ or more, 300 $\mu\text{g/mL}$ or more, 400 $\mu\text{g/mL}$ or more, 500 $\mu\text{g/mL}$ or more, 600 $\mu\text{g/mL}$ or more, 700 $\mu\text{g/mL}$ or more, 1000 $\mu\text{g/mL}$ or more, 5,000 $\mu\text{g/mL}$ or more, 7,000 $\mu\text{g/mL}$ or more, 10,000 $\mu\text{g/mL}$ or more, 20,000 $\mu\text{g/mL}$ or more, or a range defined by any two of the foregoing values) of IFN- γ upon co-culture with (a) antigen-negative, HLA Class II molecule positive target cells pulsed with a low concentration of mutated RAS peptide (e.g., about 0.05 ng/mL to about 10 ng/mL, 1 ng/mL, 2 ng/mL, 5 ng/mL, 8 ng/mL, 10 ng/mL, or a range defined by any two of the foregoing values) or (b) antigen-negative, HLA Class II molecule positive target cells into which a nucleotide sequence encoding mutated RAS has been introduced such that the target cell expresses mutated RAS. Cells expressing the inventive TCRs may also secrete IFN- γ upon co-culture with antigen-negative, HLA Class II molecule positive target cells pulsed with higher concentrations of mutated RAS peptide. The HLA Class II molecule may be any of the HLA Class II molecules described herein (e.g., an HLA-DRB1*07:01 molecule or an HLA-DRB1*11:01 molecule).

[0036] Alternatively or additionally, a TCR may be considered to have “antigenic specificity” for mutated RAS if T cells expressing the TCR secrete at least twice as much IFN- γ upon co-culture with (a) antigen-negative, HLA Class II molecule positive target cells pulsed with a low concentration of mutated RAS peptide or (b) antigen-negative, HLA Class II molecule positive target cells into which a nucleotide sequence encoding mutated RAS has been introduced such that the target cell expresses mutated RAS as compared to the amount of IFN- γ expressed by a negative control. The negative control may be, for example, (i) T cells expressing the TCR, co-cultured with (a) antigen-negative, HLA Class II molecule positive target cells pulsed with the same concentration of an irrelevant peptide (e.g., some other peptide with a different sequence from the mutated RAS peptide) or (b) antigen-negative, HLA Class II molecule positive target cells into which a nucleotide sequence encoding an irrelevant peptide has been introduced such that the target cell expresses the irrelevant peptide, or (ii) untransduced T cells (e.g., derived from PBMC, which do not express the TCR) co-cultured with (a) antigen-negative, HLA Class II molecule positive target cells pulsed with the same concentration of mutated RAS peptide or (b) antigen-negative, HLA Class II molecule positive target cells into which a nucleotide sequence encoding mutated RAS has been introduced such that the target cell expresses mutated RAS. The HLA Class II molecule expressed by the target cells of the negative control would be the same HLA Class II molecule expressed by the target cells that are co-cultured with the T cells being tested. The HLA Class II molecule may be any of the HLA Class II molecules described herein (e.g., an HLA-DRB1*07:01 molecule or an HLA-DRB1*11:01 molecule). IFN- γ secretion may be measured by methods known in the art such as, for example, enzyme-linked immunosorbent assay (ELISA).

[0037] Alternatively or additionally, a TCR may be considered to have “antigenic specificity” for mutated RAS if at least twice as many of the numbers of T cells expressing the TCR secrete IFN- γ upon co-culture with (a) antigen-negative, HLA Class II molecule positive target cells pulsed with a low concentration of mutated RAS peptide or (b) antigen-negative, HLA Class II molecule positive target cells into which a nucleotide sequence encoding mutated RAS has been introduced

such that the target cell expresses mutated RAS as compared to the numbers of negative control T cells that secrete IFN- γ . The HLA Class II molecule, concentration of peptide, and the negative control may be as described herein with respect to other aspects of the invention. The numbers of cells secreting IFN- γ may be measured by methods known in the art such as, for example, ELISPOT.

[0038] Alternatively or additionally, a TCR may be considered to have “antigenic specificity” for mutated RAS if T cells expressing the TCR upregulate expression of one or more T-cell activation markers as measured by, for example, flow cytometry after stimulation with target cells expressing mutated RAS. Examples of T-cell activation markers include 4-1BB, OX40, CD107a, CD69, and cytokines that are upregulated upon antigen stimulation (e.g., tumor necrosis factor (TNF), interleukin (IL)-2, etc.).

[0039] An embodiment of the invention provides a TCR comprising two polypeptides (i.e., polypeptide chains), such as an alpha (α) chain of a TCR, a beta (β) chain of a TCR, a gamma (γ) chain of a TCR, a delta (δ) chain of a TCR, or a combination thereof. The polypeptides of the inventive TCR can comprise any amino acid sequence, provided that the TCR has antigenic specificity for mutated RAS.

[0040] In an embodiment of the invention, the TCR comprises two polypeptide chains, each of which comprises a variable region comprising a complementarity determining region (CDR)1, a CDR2, and a CDR3 of a TCR. In an embodiment of the invention, the TCR comprises a first polypeptide chain comprising a CDR1 comprising the amino acid sequence of SEQ ID NO: 1 (CDR1 of α chain), a CDR2 comprising the amino acid sequence of SEQ ID NO: 2 (CDR2 of α chain), and a CDR3 comprising the amino acid sequence of SEQ ID NO: 3 (CDR3 of α chain), and a second polypeptide chain comprising a CDR1 comprising the amino acid sequence of SEQ ID NO: 4 (CDR1 of β chain), a CDR2 comprising the amino acid sequence of SEQ ID NO: 5 (CDR2 of β chain), and a CDR3 comprising the amino acid sequence of SEQ ID NO: 6 (CDR3 of β chain).

[0041] In another embodiment of the invention, the TCR comprises a first polypeptide chain comprising a CDR1 comprising the amino acid sequence of SEQ ID NO: 7 (CDR1 of α chain), a CDR2 comprising the amino acid sequence of SEQ ID NO: 8 (CDR2 of α chain), and a CDR3 comprising the amino acid sequence of SEQ ID NO: 9 (CDR3 of α chain), and a second polypeptide chain comprising a CDR1 comprising the amino acid sequence of SEQ ID NO: 10 (CDR1 of β chain), a CDR2 comprising the amino acid sequence of SEQ ID NO: 11 (CDR2 of β chain), and a CDR3 comprising the amino acid sequence of SEQ ID NO: 12 (CDR3 of β chain).

[0042] In this regard, the inventive TCR can comprise any one or more of the amino acid sequences selected from the group consisting of SEQ ID NOs:1-12. In an embodiment of the invention, the TCR comprises the amino acid sequences of: (a) all of SEQ ID NOs: 1-3, (b) all of SEQ ID NOs: 4-6, (c) all of SEQ ID NOs: 7-9, (d) all of SEQ ID NOs: 10-12, (e) all of SEQ ID NOs: 1-6, or (f) all of SEQ ID NOs: 7-12. In an especially preferred embodiment, the TCR comprises the amino acid sequences of (i) all of SEQ ID NOs: 1-6 or (ii) all of SEQ ID NOs: 7-12.

[0043] In an embodiment of the invention, the TCR comprises an amino acid sequence of a variable region of a TCR comprising the CDRs set forth above. In this regard, the TCR can comprise the amino acid sequence of: SEQ ID NO: 13 (variable region of α chain); SEQ ID NO: 14 (variable region of β chain); SEQ ID NO: 15 (variable region of α chain); SEQ ID NO: 16 (variable region of β chain); both of SEQ ID NOs: 13 and 14; or both of SEQ ID NOs: 15 and 16. Preferably, the TCR comprises the amino acid sequences of (i) both of SEQ ID NOs: 13 and 14 or (ii) both of SEQ ID NOs: 15 and 16.

[0044] The inventive TCRs may further comprise an α chain constant region and a β chain constant region. The constant region may be derived from any suitable species such as, e.g., human or mouse. In an embodiment of the invention, the TCRs further comprise murine α and β chain constant regions or human α and β chain constant regions. As used herein, the term “murine” or “human,” when referring to a TCR or any component of a TCR described herein (e.g.,

complementarity determining region (CDR), variable region, constant region, α chain, and/or β chain), means a TCR (or component thereof) which is derived from a mouse or a human, respectively, i.e., a TCR (or component thereof) that originated from or was, at one time, expressed by a mouse T cell or a human T cell, respectively.

[0045] An embodiment of the invention provides a chimeric TCR comprising a human variable region and a murine constant region, wherein the TCR has antigenic specificity for a mutated human RAS amino acid sequence presented by an HLA Class II molecule. The murine constant region may provide any one or more advantages. For example, the murine constant region may diminish mispairing of the inventive TCR with the endogenous TCRs of the host cell into which the inventive TCR is introduced. Alternatively or additionally, the murine constant region may increase expression of the inventive TCR as compared to the same TCR with a human constant region. The chimeric TCR may comprise the amino acid sequence of SEQ ID NO: 32 (wild-type (WT) murine α chain constant region), SEQ ID NO: 33 (WT murine β chain constant region), or both SEQ ID NOs: 32 and 33. Preferably, the inventive TCR comprises the amino acid sequences of both of SEQ ID NOs: 32 and 33. The chimeric TCR may comprise any of the murine constant regions described herein in combination with any of the CDR regions as described herein with respect to other aspects of the invention. In this regard, the TCR may comprise the amino acid sequences of (a) all of SEQ ID NOs: 1-3 and 32; (b) all of SEQ ID NOs: 4-6 and 33; (c) all of SEQ ID NOs: 7-9 and 32; (d) all of SEQ ID NOs: 10-12 and 33; (e) all of SEQ ID NOs: 1-6 and 32-33; or (f) all of SEQ ID NOs: 7-12 and 32-33. In another embodiment of the invention, the chimeric TCR may comprise any of the murine constant regions described herein in combination with any of the variable regions described herein with respect to other aspects of the invention. In this regard, the TCR may comprise the amino acid sequences of (i) both of SEQ ID NOs: 13 and 32; (ii) both of SEQ ID NOs: 14 and 33; (iii) both of SEQ ID NOs: 15 and 32; (iv) both of SEQ ID NOs: 16 and 33; (v) all of SEQ ID NOs: 13-14 and 32-33; or (vi) all of SEQ ID NOs: 15-16 and 32-33.

[0046] In another embodiment of the invention, the TCR comprises the amino acid sequence(s) of: SEQ ID NO: 38 (α chain with WT murine constant region), SEQ ID NO: 39 (β chain with WT murine constant region), SEQ ID NO: 40 (α chain with WT murine constant region), SEQ ID NO: 41 (D chain with WT murine constant region), both of SEQ ID NO: 38-39, or both of SEQ ID NO: 40-41.

[0047] In an embodiment of the invention, the TCR comprises an α chain comprising a variable region and a constant region and a β chain comprising a variable region and a constant region. In this regard, the TCR may comprise (a) an α chain comprising the amino acid sequence of SEQ ID NO: 34, wherein: (i) X at position 179 of SEQ ID NO: 34 is Thr or Cys; (ii) X at position 243 of SEQ ID NO: 34 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 245 of SEQ ID NO: 34 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 246 of SEQ ID NO: 34 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) a β chain comprising the amino acid sequence of SEQ ID NO: 35, wherein X at position 189 of SEQ ID NO: 35 is Ser or Cys; (c) an α chain comprising the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (d) a β chain comprising the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; (e) both (a) and (b); or (f) both (c) and (d).

[0048] In an embodiment of the invention, the TCR comprises a substituted constant region. In this regard, the TCR may comprise the amino acid sequence of any of the TCRs described herein with one, two, three, or four amino acid substitution(s) in the constant region of one or both of the α and β chain. Preferably, the TCR comprises a murine constant region with one, two, three, or four amino acid substitution(s) in the murine constant region of one or both of the α and β chains. In an especially preferred embodiment, the TCR comprises a murine constant region with one, two,

three, or four amino acid substitution(s) in the murine constant region of the α chain and one amino acid substitution in the murine constant region of the β chain. In some embodiments, the TCRs comprising the substituted constant region advantageously provide one or more of increased recognition of mutated RAS.sup.+ targets, increased expression by a host cell, diminished mispairing with endogenous TCRs, and increased anti-tumor activity as compared to the parent TCR comprising an unsubstituted (wild-type) constant region. In general, the substituted amino acid sequences of the murine constant regions of the TCR α and β chains, SEQ ID NOs: 30 and 31, respectively, correspond with all or portions of the unsubstituted murine constant region amino acid sequences SEQ ID NOs: 32 and 33, respectively, with SEQ ID NO: 30 having one, two, three, or four amino acid substitution(s) when compared to SEQ ID NO: 32 and SEQ ID NO: 31 having one amino acid substitution when compared to SEQ ID NO: 33. In this regard, an embodiment of the invention provides a TCR comprising the amino acid sequences of (a) SEQ ID NO: 30 (constant region of α chain), wherein (i) X at position 48 is Thr or Cys; (ii) X at position 112 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 114 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 115 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) SEQ ID NO: 31 (constant region of β chain), wherein X at position 57 is Ser or Cys; or (c) both of SEQ ID NOs: 30 and 31. In an embodiment of the invention, the TCR comprising SEQ ID NO: 30 does not comprise SEQ ID NO: 32 (unsubstituted murine constant region of α chain). In an embodiment of the invention, the TCR comprising SEQ ID NO: 31 does not comprise SEQ ID NO: 33 (unsubstituted murine constant region of β chain).

[0049] In an embodiment of the invention, the substituted constant region includes cysteine substitutions in the constant region of one or both of the α and β chains to provide a cysteine-substituted TCR. Opposing cysteines in the α and the β chains provide a disulfide bond that links the constant regions of the α and the β chains of the substituted TCR to one another and which is not present in a TCR comprising the unsubstituted murine constant regions. In this regard, the TCR may be a cysteine-substituted TCR in which one or both of the native Thr at position 48 (Thr48) of SEQ ID NO: 32 and the native Ser at position 57 (Ser57) of SEQ ID NO: 33 may be substituted with Cys. Preferably, both of the native Thr48 of SEQ ID NO: 32 and the native Ser57 of SEQ ID NO: 33 are substituted with Cys. Examples of cysteine-substituted TCR constant regions sequences are set forth in Table 2. In an embodiment of the invention, the cysteine-substituted TCR comprises (i) SEQ ID NO: 30, (ii) SEQ ID NO: 31, or (iii) both of SEQ ID NOs: 30 and 31, wherein both of SEQ ID NOs: 30 and 31 are as defined in Table 2. The cysteine-substituted TCRs of the invention may include the substituted constant region in addition to any of the CDRs or variable regions described herein.

[0050] In an embodiment of the invention, the cysteine-substituted, chimeric TCR comprises a full length alpha chain and a full-length beta chain. Examples of cysteine-substituted, chimeric TCR alpha chain and beta chain sequences are set forth in Table 2. In an embodiment of the invention, the TCR comprises (i) SEQ ID NO: 34, (ii) SEQ ID NO: 35, (iii) SEQ ID NO: 36, (iv) SEQ ID NO: 37, (v) both of SEQ ID NO: 34 and 35, or (vi) both of SEQ ID NO: 36 and 37, wherein all of SEQ ID NO: 34-37 are as defined in Table 2.

TABLE-US-00002 TABLE 2 SEQ ID NO: Definitions of "X" SEQ ID NO: 30 X at position 48 is Cys, (constant region α chain) X at position 112 is Ser, X at position 114 is Met, and X at position 115 is Gly. SEQ ID NO: 31 X at position 57 is Cys (constant region β chain) SEQ ID NO: 34 X at position 179 is Cys, (RAS.sup.G12V-HLA- X at position 243 is Ser, DRB1*07:01 α chain) X at position 245 is Met, and X at position 246 is Gly. SEQ ID NO: 35 X at position 189 is Cys (RAS.sup.G12V-HLA- DRB1*07:01 β chain) SEQ ID NO: 36 X at position 180 Cys, (RAS.sup.G12C-HLA- X at position 244 is Ser, DRB1*11:01 α chain) X at position 246 is Met, and X at position 247 is Gly. SEQ ID NO: 37 X at position 194 Cys (RAS.sup.G12C-HLA- DRB1*11:01 β chain)

[0051] In an embodiment of the invention, the substituted amino acid sequence includes

substitutions of one, two, or three amino acids in the transmembrane (TM) domain of the constant region of one or both of the α and β chains with a hydrophobic amino acid to provide a hydrophobic amino acid-substituted TCR (also referred to herein as an “LVL-modified TCR”). The hydrophobic amino acid substitution(s) in the TM domain of the TCR may increase the hydrophobicity of the TM domain of the TCR as compared to a TCR that lacks the hydrophobic amino acid substitution(s) in the TM domain. In this regard, the TCR is an LVL-modified TCR in which one, two, or three of the native Ser112, Met114, and Gly115 of SEQ ID NO: 32 may, independently, be substituted with Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably with Leu, Ile, or Val. Preferably, all three of the native Ser112, Met114, and Gly115 of SEQ ID NO: 32 may, independently, be substituted with Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably with Leu, Ile, or Val. In an embodiment of the invention, the LVL-modified TCR comprises (i) SEQ ID NO: 30, (ii) SEQ ID NO: 31, or (iii) both of SEQ ID NOs: 30 and 31, wherein both of SEQ ID NOs: 30 and 31 are as defined in Table 3. The LVL-modified TCRs of the invention may include the substituted constant region in addition to any of the CDRs or variable regions described herein. [0052] In an embodiment of the invention, the LVL-modified TCR comprises a full length alpha chain and a full-length beta chain. Examples of LVL-modified TCR alpha chain and beta chain sequences are set forth in Table 3. In an embodiment of the invention, the LVL-modified TCR comprises (i) SEQ ID NO: 34, (ii) SEQ ID NO: 35, (iii) SEQ ID NO: 36, (iv) SEQ ID NO: 37, (v) both of SEQ ID NO: 34 and 35, or (vi) both of SEQ ID NO: 36 and 37, wherein all of SEQ ID NO: 34-37 are as defined in Table 3.

TABLE-US-00003 TABLE 3 SEQ ID NO: Definitions of “X” SEQ ID NO: 30 X at position 48 is Thr; (constant region α X at position 112 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; chain) preferably wherein X at position 112 is Leu, Ile, or Val; especially preferably wherein X at position 112 is Leu; X at position 114 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 114 is Leu, Ile, or Val; especially preferably wherein X at position 114 is Ile; and X at position 115 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 115 is Leu, Ile, or Val; especially preferably wherein X at position 115 is Val; Wherein SEQ ID NO: 30 does not comprise SEQ ID NO: 32 (unsubstituted constant region of alpha chain) SEQ ID NO: 31 X at position 57 is Ser (constant region β chain) SEQ ID NO: 34 X at position 179 is Thr; (RAS.sup.G12V-HLA- X at position 243 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; DRB1*07:01 α chain) preferably wherein X at position 243 is Leu, Ile, or Val; especially preferably wherein X at position 243 is Leu; X at position 245 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 245 is Leu, Ile, or Val; especially preferably wherein X at position 245 is Ile; and X at position 246 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 246 is Leu, Ile, or Val; especially preferably wherein X at position 246 is Val, Wherein SEQ ID NO: 34 does not comprise SEQ ID NO: 38 (unsubstituted alpha chain) SEQ ID NO: 35 X at position 189 is Ser (RAS.sup.G12V-HLA- DRB1*07:01 β chain) SEQ ID NO: 36 X at position 180 is Thr; (RAS.sup.G12C-HLA- X at position 244 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; DRB1*11:01 α chain) preferably wherein X at position 244 is Leu, Ile, or Val; especially preferably wherein X at position 244 is Leu; X at position 246 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 246 is Leu, Ile, or Val; especially preferably wherein X at position 246 is Ile; and X at position 247 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 247 is Leu, Ile, or Val; especially preferably wherein X at position 247 is Val; Wherein SEQ ID NO: 36 does not comprise SEQ ID NO: 40 (unsubstituted alpha chain) SEQ ID NO: 37 X at position 194 is Ser (RAS.sup.G12C-HLA- DRB1*11:01 β chain)

[0053] In an embodiment of the invention, the substituted amino acid sequence includes the cysteine substitutions in the constant region of one or both of the α and β chains in combination with the substitution(s) of one, two, or three amino acids in the transmembrane (TM) domain of the constant region of one or both of the α and β chains with a hydrophobic amino acid (also referred to herein as “cysteine-substituted, LVL-modified TCR”). In this regard, the TCR is a cysteine-

substituted, LVL-modified, chimeric TCR in which the native Thr48 of SEQ ID NO: 32 is substituted with Cys; one, two, or three of the native Ser112, Met114, and Gly115 of SEQ ID NO: 32 are, independently, substituted with Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably with Leu, Ile, or Val; and the native Ser57 of SEQ ID NO: 33 is substituted with Cys. Preferably, all three of the native Ser112, Met114, and Gly115 of SEQ ID NO: 32 may, independently, be substituted with Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably with Leu, Ile, or Val. In an embodiment of the invention, the cysteine-substituted, LVL-modified TCR comprises (i) SEQ ID NO: 30, (ii) SEQ ID NO: 31, or (iii) both of SEQ ID NOs: 30 and 31, wherein both of SEQ ID NOs: 30 and 31 are as defined in Table 4. The cysteine-substituted, LVL-modified TCRs of the invention may include the substituted constant region in addition to any of the CDRs or variable regions described herein.

[0054] In an embodiment, the cysteine-substituted, LVL-modified TCR comprises a full-length alpha chain and a full-length beta chain. In an embodiment of the invention, the cysteine-substituted, LVL-modified TCR comprises (i) SEQ ID NO: 34, (ii) SEQ ID NO: 35, (iii) SEQ ID NO: 36, (iv) SEQ ID NO: 37, (v) both of SEQ ID NO: 34 and 35, or (vi) both of SEQ ID NO: 36 and 37, wherein all of SEQ ID NO: 34-37 are as defined in Table 4.

TABLE-US-00004 TABLE 4 SEQ ID NO: Definitions of “X” SEQ ID NO: 30 X at position 48 is Cys; (constant region α X at position 112 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; chain) preferably wherein X at position 112 is Leu, Ile, or Val; especially preferably wherein X at position 112 is Leu; X at position 114 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 114 is Leu, Ile, or Val; especially preferably wherein X at position 114 is Ile; and X at position 115 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 115 is Leu, Ile, or Val; and especially preferably wherein X at position 115 is Val, wherein SEQ ID NO: 30 does not simultaneously comprise all of Ser at position 112, Met at position 114, and Gly at position 115. SEQ ID NO: 31 X at position 57 is Cys (constant region β chain) SEQ ID NO: 34 X at position 179 is Cys; (RAS.sup.G12V-HLA- X at position 243 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; DRB1*07:01 α chain) preferably wherein X at position 243 is Leu, Ile, or Val; especially preferably wherein X at position 243 is Leu; X at position 245 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 245 is Leu, Ile, or Val; especially preferably wherein X at position 245 is Ile; and X at position 246 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 246 is Leu, Ile, or Val; and especially preferably wherein X at position 246 is Val, wherein SEQ ID NO: 34 does not simultaneously comprise all of Ser at position 243, Met at position 245, and Gly at position 246. SEQ ID NO: 35 X at position 189 is Cys (RAS.sup.G12V-HLA- DRB1*07:01 β chain) SEQ ID NO: 36 X at position 180 is Cys; (RAS.sup.G12C-HLA- X at position 244 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; DRB1*11:01 α chain) preferably wherein X at position 244 is Leu, Ile, or Val; especially preferably wherein X at position 244 is Leu; X at position 246 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; preferably wherein X at position 246 is Leu, Ile, or Val; especially preferably wherein X at position 246 is Ile; and X at position 247 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; preferably wherein X at position 247 is Leu, Ile, or Val; and especially preferably wherein X at position 247 is Val, wherein SEQ ID NO: 36 does not simultaneously comprise all of Ser at position 244, Met at position 246, and Gly at position 247. SEQ ID NO: 37 X at position 194 is Cys (RAS.sup.G12C-HLA- DRB1*11:01 β chain)

[0055] Also provided by the invention is a polypeptide comprising a functional portion of any of the TCRs described herein. The term “polypeptide,” as used herein, includes oligopeptides and refers to a single chain of amino acids connected by one or more peptide bonds.

[0056] With respect to the inventive polypeptides, the functional portion can be any portion comprising contiguous amino acids of the TCR of which it is a part, provided that the functional portion specifically binds to mutated RAS. The term “functional portion,” when used in reference to a TCR, refers to any part or fragment of the TCR of the invention, which part or fragment retains

the biological activity of the TCR of which it is a part (the parent TCR). Functional portions encompass, for example, those parts of a TCR that retain the ability to specifically bind to mutated RAS (e.g., within the context of an HLA-DRB1*07:01 molecule or an HLA-DRB1*11:01 molecule), or detect, treat, or prevent cancer, to a similar extent, the same extent, or to a higher extent, as the parent TCR. In reference to the parent TCR, the functional portion can comprise, for instance, about 10%, about 25%, about 30%, about 50%, about 68%, about 80%, about 90%, about 95%, or more, of the parent TCR.

[0057] The functional portion can comprise additional amino acids at the amino or carboxy terminus of the portion, or at both termini, which additional amino acids are not found in the amino acid sequence of the parent TCR. Desirably, the additional amino acids do not interfere with the biological function of the functional portion, e.g., specifically binding to mutated RAS; and/or having the ability to detect cancer, treat or prevent cancer, etc. More desirably, the additional amino acids enhance the biological activity, as compared to the biological activity of the parent TCR.

[0058] The polypeptide can comprise a functional portion of either or both of the α and β chains of the TCRs of the invention, such as a functional portion comprising one or more of the CDR1, CDR2, and CDR3 of the variable region(s) of the α chain and/or β chain of a TCR of the invention. In an embodiment of the invention, the polypeptide can comprise the amino acid sequence of SEQ ID NO: 1 (CDR1 of α chain), SEQ ID NO: 2 (CDR2 of α chain), SEQ ID NO: 3 (CDR3 of α chain), SEQ ID NO: 4 (CDR1 of β chain), SEQ ID NO: 5 (CDR2 of β chain), SEQ ID NO: 6 (CDR3 of β chain), or a combination thereof. In another embodiment of the invention, the polypeptide can comprise the amino acid sequence of SEQ ID NO: 7 (CDR1 of α chain), SEQ ID NO: 8 (CDR2 of α chain), SEQ ID NO: 9 (CDR3 of α chain), SEQ ID NO: 10 (CDR1 of β chain), SEQ ID NO: 11 (CDR2 of β chain), SEQ ID NO: 12 (CDR3 of β chain), or a combination thereof.

[0059] In this regard, the inventive polypeptide can comprise any one or more of the amino acid sequences selected from the group consisting of SEQ ID NOs: 1-12. In an embodiment of the invention, the TCR comprises the amino acid sequences of: (a) all of SEQ ID NOs: 1-3, (b) all of SEQ ID NOs: 4-6, (c) all of SEQ ID NOs: 7-9, (d) all of SEQ ID NOs: 10-12, (e) all of SEQ ID NOs: 1-6, or (f) all of SEQ ID NOs: 7-12. In a preferred embodiment, the polypeptide comprises the amino acid sequences of: (i) all of SEQ ID NOs: 1-6 or (ii) all of SEQ ID NOs: 7-12.

[0060] In an embodiment of the invention, the inventive polypeptide can comprise, for instance, the variable region of the inventive TCR comprising a combination of the CDR regions set forth above. In this regard, the polypeptide can comprise the amino acid sequence of (i) SEQ ID NO: 13 (variable region of α chain), (ii) SEQ ID NO: 14 (variable region of β chain), (iii) both of SEQ ID NOs: 13 and 14, (iv) SEQ ID NO: 15 (variable region of α chain), (v) SEQ ID NO: 16 (variable region of β chain), or (vi) both of SEQ ID NOs: 15 and 16. Preferably, the polypeptide comprises the amino acid sequences of (i) both or SEQ ID NOs: 13 and 14 or (ii) both of SEQ ID NOs: 15 and 16.

[0061] In an embodiment of the invention, the inventive polypeptide can further comprise the constant region of the inventive TCR set forth above. In this regard, the polypeptide can further comprise the amino acid sequence of SEQ ID NO: 32 (WT murine constant region of α chain), SEQ ID NO: 33 (WT murine constant region of β chain), SEQ ID NO: 30 (substituted murine constant region of α chain), SEQ ID NO: 31 (substituted murine constant region of β chain), both SEQ ID NOs: 32 and 33, or both SEQ ID NOs: 30 and 31. Preferably, the polypeptide further comprises the amino acid sequences of both of SEQ ID NOs: 30 and 31 or both of SEQ ID NO: 32 and 33 in combination with any of the CDR regions or variable regions described herein with respect to other aspects of the invention. In an embodiment of the invention, one or both of SEQ ID NOs: 30 and 31 of the polypeptide are as defined in any one of Tables 2-4.

[0062] In an embodiment of the invention, the inventive polypeptide can comprise the entire length of an α or β chain of the TCR described herein. In this regard, the inventive polypeptide can comprise the amino acid sequence of SEQ ID NO: 34, SEQ ID NO: 35, SEQ ID NO: 36, and SEQ

ID NO: 37. Alternatively, the polypeptide of the invention can comprise both chains of the TCRs described herein.

[0063] For example, the polypeptide of the invention can comprise (a) the amino acid sequence of SEQ ID NO: 34, wherein: (i) X at position 179 of SEQ ID NO: 34 is Thr or Cys; (ii) X at position 243 of SEQ ID NO: 34 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 245 of SEQ ID NO: 34 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 246 of SEQ ID NO: 34 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) the amino acid sequence of SEQ ID NO: 35, wherein X at position 189 of SEQ ID NO: 35 is Ser or Cys; (c) the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (d) the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; (e) both (a) and (b); or (f) both (c) and (d). In an embodiment of the invention, any one or more of SEQ ID NOs: 34-37 of the polypeptide are as defined in any one of Tables 2-4.

[0064] The invention further provides a protein comprising at least one of the polypeptides described herein. By “protein” is meant a molecule comprising one or more polypeptide chains.

[0065] In an embodiment, the protein of the invention can comprise (a) a first polypeptide chain comprising the amino acid sequences of SEQ ID NOs: 1-3 and a second polypeptide chain comprising the amino acid sequence of SEQ ID NOs: 4-6; or (b) a first polypeptide chain comprising the amino acid sequences of SEQ ID NOs: 7-9 and a second polypeptide chain comprising the amino acid sequences of SEQ ID NOs: 10-12.

[0066] In another embodiment of the invention, the protein may comprise (i) a first polypeptide chain comprising the amino acid sequences of SEQ ID NO: 13 and a second polypeptide chain comprising the amino acid sequences of SEQ ID NO: 14; or (ii) a first polypeptide chain comprising the amino acid sequences of SEQ ID NO: 15 and a second polypeptide chain comprising the amino acid sequences of SEQ ID NO: 16.

[0067] The inventive protein may further comprise any of the constant regions described herein with respect to other aspects of the invention. In this regard, in an embodiment of the invention, the first polypeptide chain may further comprise the amino acid sequence of SEQ ID NO: 30 or SEQ ID NO: 32 and the second polypeptide chain may further comprise the amino acid sequence of SEQ ID NO: 31 or SEQ ID NO: 33. In an embodiment of the invention, one or both of SEQ ID NOs: 30 and 31 of the protein are as defined in any one of Tables 2-4.

[0068] Alternatively or additionally, the protein of an embodiment of the invention can comprise (a) a first polypeptide chain comprising the amino acid sequence of SEQ ID NO: 34, wherein: (i) X at position 179 of SEQ ID NO: 34 is Thr or Cys; (ii) X at position 243 of SEQ ID NO: 34 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 245 of SEQ ID NO: 34 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 246 of SEQ ID NO: 34 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) a second polypeptide chain comprising the amino acid sequence of SEQ ID NO: 35, wherein X at position 189 of SEQ ID NO: 35 is Ser or Cys; (c) a first polypeptide chain comprising the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (d) a second polypeptide chain comprising the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; (e) both (a) and (b); or (f) both (c) and (d). In an embodiment of the invention, one or more of SEQ ID NOs: 34-37 are as defined in any one of Tables 2-4.

[0069] The protein of the invention can be a TCR. Alternatively, if, for example, the protein comprises a single polypeptide chain comprising the amino acid sequences of both SEQ ID NOs:

34 and 35, both SEQ ID NOs: 36 and 37, or if the first and/or second polypeptide chain(s) of the protein further comprise(s) other amino acid sequences, e.g., an amino acid sequence encoding an immunoglobulin or a portion thereof, then the inventive protein can be a fusion protein. In this regard, the invention also provides a fusion protein comprising at least one of the inventive polypeptides described herein along with at least one other polypeptide. The other polypeptide can exist as a separate polypeptide of the fusion protein, or can exist as a polypeptide, which is expressed in frame (in tandem) with one of the inventive polypeptides described herein. The other polypeptide can encode any peptidic or proteinaceous molecule, or a portion thereof, including, but not limited to an immunoglobulin, CD3, CD4, CD8, an MHC molecule, a CD1 molecule, e.g., CD1a, CD1b, CD1c, CD1d, etc.

[0070] The fusion protein can comprise one or more copies of the inventive polypeptide and/or one or more copies of the other polypeptide. For instance, the fusion protein can comprise 1, 2, 3, 4, 5, or more, copies of the inventive polypeptide and/or of the other polypeptide. Suitable methods of making fusion proteins are known in the art, and include, for example, recombinant methods.

[0071] In some embodiments of the invention, the TCRs, polypeptides, and proteins of the invention may be expressed as a single protein comprising a linker peptide linking the α chain and the β chain. In this regard, the TCRs, polypeptides, and proteins of the invention may further comprise a linker peptide. The linker peptide may advantageously facilitate the expression of a recombinant TCR, polypeptide, and/or protein in a host cell. The linker peptide may comprise any suitable amino acid sequence. For example, the linker peptide may be a furin-SGSG-P2A linker comprising the amino acid sequence of SEQ ID NO:54. Upon expression of the construct including the linker peptide by a host cell, the linker peptide may be cleaved, resulting in separated α and β chains. In an embodiment of the invention, the TCR, polypeptide, or protein may comprise an amino acid sequence comprising a full-length α chain, a full-length β chain, and a linker peptide positioned between the α and β chains.

[0072] The protein of the invention can be a recombinant antibody, or an antigen binding portion thereof, comprising at least one of the inventive polypeptides described herein. As used herein, "recombinant antibody" refers to a recombinant (e.g., genetically engineered) protein comprising at least one of the polypeptides of the invention and a polypeptide chain of an antibody, or an antigen binding portion thereof. The polypeptide of an antibody, or antigen binding portion thereof, can be a heavy chain, a light chain, a variable or constant region of a heavy or light chain, a single chain variable fragment (scFv), or an Fc, Fab, or F(ab).sub.2' fragment of an antibody, etc. The polypeptide chain of an antibody, or an antigen binding portion thereof, can exist as a separate polypeptide of the recombinant antibody. Alternatively, the polypeptide chain of an antibody, or an antigen binding portion thereof, can exist as a polypeptide, which is expressed in frame (in tandem) with the polypeptide of the invention. The polypeptide of an antibody, or an antigen binding portion thereof, can be a polypeptide of any antibody or any antibody fragment, including any of the antibodies and antibody fragments described herein.

[0073] Included in the scope of the invention are functional variants of the inventive TCRs, polypeptides, or proteins described herein. The term "functional variant," as used herein, refers to a TCR, polypeptide, or protein having substantial or significant sequence identity or similarity to a parent TCR, polypeptide, or protein, which functional variant retains the biological activity of the TCR, polypeptide, or protein of which it is a variant. Functional variants encompass, for example, those variants of the TCR, polypeptide, or protein described herein (the parent TCR, polypeptide, or protein) that retain the ability to specifically bind to mutated RAS for which the parent TCR has antigenic specificity or to which the parent polypeptide or protein specifically binds, to a similar extent, the same extent, or to a higher extent, as the parent TCR, polypeptide, or protein. In reference to the parent TCR, polypeptide, or protein, the functional variant can, for instance, be at least about 30%, about 50%, about 75%, about 80%, about 90%, about 95%, about 96%, about 97%, about 98%, about 99% or more identical in amino acid sequence to the parent TCR,

polypeptide, or protein, respectively.

[0074] The functional variant can, for example, comprise the amino acid sequence of the parent TCR, polypeptide, or protein with at least one conservative amino acid substitution. Conservative amino acid substitutions are known in the art, and include amino acid substitutions in which one amino acid having certain physical and/or chemical properties is exchanged for another amino acid that has the same chemical or physical properties. For instance, the conservative amino acid substitution can be an acidic amino acid substituted for another acidic amino acid (e.g., Asp or Glu), an amino acid with a nonpolar side chain substituted for another amino acid with a nonpolar side chain (e.g., Ala, Gly, Val, Ile, Leu, Met, Phe, Pro, Trp, Val, etc.), a basic amino acid substituted for another basic amino acid (Lys, Arg, etc.), an amino acid with a polar side chain substituted for another amino acid with a polar side chain (Asn, Cys, Gln, Ser, Thr, Tyr, etc.), etc.

[0075] Alternatively or additionally, the functional variants can comprise the amino acid sequence of the parent TCR, polypeptide, or protein with at least one non-conservative amino acid substitution. In this case, it is preferable for the non-conservative amino acid substitution to not interfere with or inhibit the biological activity of the functional variant. Preferably, the non-conservative amino acid substitution enhances the biological activity of the functional variant, such that the biological activity of the functional variant is increased as compared to the parent TCR, polypeptide, or protein.

[0076] The TCR, polypeptide, or protein can consist essentially of the specified amino acid sequence or sequences described herein, such that other components of the TCR, polypeptide, or protein, e.g., other amino acids, do not materially change the biological activity of the TCR, polypeptide, or protein. In this regard, the inventive TCR, polypeptide, or protein can, for example, consist essentially of the amino acid sequence of SEQ ID NO: 34, SEQ ID NO: 35, SEQ ID NO: 36, SEQ ID NO: 37, both of SEQ ID NOs: 34-35 or both of SEQ ID NO: 36-37. Also, for instance, the inventive TCRs, polypeptides, or proteins can consist essentially of the amino acid sequence(s) of (i) SEQ ID NO: 13, (ii) SEQ ID NO: 14, (iii) SEQ ID NO: 15, (iv) SEQ ID NO: 16, (v) both of SEQ ID NOs: 13 and 14, or (vi) both of SEQ ID NOs: 15 and 16. Furthermore, the inventive TCRs, polypeptides, or proteins can consist essentially of the amino acid sequences of (a) any one or more of SEQ ID NOs: 1-12; (b) all of SEQ ID NO: 1-3; (c) all of SEQ ID NO: 4-6; (d) all of SEQ ID NO: 7-9; (e) all of SEQ ID NOs: 10-12; (f) all of SEQ ID NOs: 1-6; or (g) all of SEQ ID NOs: 7-12.

[0077] The TCRs, polypeptides, and proteins of the invention can be of any length, i.e., can comprise any number of amino acids, provided that the TCRs, polypeptides, or proteins retain their biological activity, e.g., the ability to specifically bind to mutated RAS; detect cancer in a mammal; or treat or prevent cancer in a mammal, etc. For example, the polypeptide can be in the range of from about 50 to about 5000 amino acids long, such as about 50, about 70, about 75, about 100, about 125, about 150, about 175, about 200, about 300, about 400, about 500, about 600, about 700, about 800, about 900, about 1000 or more amino acids in length. In this regard, the polypeptides of the invention also include oligopeptides.

[0078] The TCRs, polypeptides, and proteins of the invention can comprise synthetic amino acids in place of one or more naturally-occurring amino acids. Such synthetic amino acids are known in the art, and include, for example, aminocyclohexane carboxylic acid, norleucine, α -amino n-decanoic acid, homoserine, S-acetylaminoethyl-cysteine, trans-3- and trans-4-hydroxyproline, 4-aminophenylalanine, 4-nitrophenylalanine, 4-chlorophenylalanine, 4-carboxyphenylalanine, β -phenylserine β -hydroxyphenylalanine, phenylglycine, α -naphthylalanine, cyclohexylalanine, cyclohexylglycine, indoline-2-carboxylic acid, 1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid, aminomalonic acid, aminomalonic acid monoamide, N'-benzyl-N'-methyl-lysine, N',N'-dibenzyl-lysine, 6-hydroxylysine, ornithine, α -aminocyclopentane carboxylic acid, α -aminocyclohexane carboxylic acid, α -aminocycloheptane carboxylic acid, α -(2-amino-2-norbornane)-carboxylic acid, α,γ -diaminobutyric acid, α,β -diaminopropionic acid, homophenylalanine, and α -tert-butylglycine.

[0079] The TCRs, polypeptides, and proteins of the invention can be glycosylated, amidated, carboxylated, phosphorylated, esterified, N-acylated, cyclized via, e.g., a disulfide bridge, or converted into an acid addition salt and/or optionally dimerized or polymerized, or conjugated.

[0080] The TCR, polypeptide, and/or protein of the invention can be obtained by methods known in the art such as, for example, de novo synthesis. Also, polypeptides and proteins can be recombinantly produced using the nucleic acids described herein using standard recombinant methods. See, for instance, Green and Sambrook, *Molecular Cloning: A Laboratory Manual*, 4^{sup}.th ed., Cold Spring Harbor Press, Cold Spring Harbor, NY (2012). Alternatively, the TCRs, polypeptides, and/or proteins described herein can be commercially synthesized by companies, such as Synpep (Dublin, CA), Peptide Technologies Corp. (Gaithersburg, MD), and Multiple Peptide Systems (San Diego, CA). In this respect, the inventive TCRs, polypeptides, and proteins can be synthetic, recombinant, isolated, and/or purified.

[0081] Included in the scope of the invention are conjugates, e.g., bioconjugates, comprising any of the inventive TCRs, polypeptides, or proteins (including any of the functional portions or variants thereof), nucleic acids, recombinant expression vectors, host cells, populations of host cells, or antibodies, or antigen binding portions thereof. Conjugates, as well as methods of synthesizing conjugates in general, are known in the art.

[0082] An embodiment of the invention provides a nucleic acid comprising a nucleotide sequence encoding any of the TCRs, polypeptides, or proteins described herein. “Nucleic acid,” as used herein, includes “polynucleotide,” “oligonucleotide,” and “nucleic acid molecule,” and generally means a polymer of DNA or RNA, which can be single-stranded or double-stranded, which can contain natural, non-natural or altered nucleotides, and which can contain a natural, non-natural or altered internucleotide linkage, such as a phosphoroamidate linkage or a phosphorothioate linkage, instead of the phosphodiester found between the nucleotides of an unmodified oligonucleotide. In an embodiment, the nucleic acid comprises complementary DNA (cDNA). It is generally preferred that the nucleic acid does not comprise any insertions, deletions, inversions, and/or substitutions. However, it may be suitable in some instances, as discussed herein, for the nucleic acid to comprise one or more insertions, deletions, inversions, and/or substitutions.

[0083] Preferably, the nucleic acids of the invention are recombinant. As used herein, the term “recombinant” refers to (i) molecules that are constructed outside living cells by joining natural or synthetic nucleic acid segments to nucleic acid molecules that can replicate in a living cell, or (ii) molecules that result from the replication of those described in (i) above. For purposes herein, the replication can be in vitro replication or in vivo replication.

[0084] The nucleic acids can be constructed based on chemical synthesis and/or enzymatic ligation reactions using procedures known in the art. See, for example, Green and Sambrook et al., supra. For example, a nucleic acid can be chemically synthesized using naturally occurring nucleotides or variously modified nucleotides designed to increase the biological stability of the molecules or to increase the physical stability of the duplex formed upon hybridization (e.g., phosphorothioate derivatives and acridine substituted nucleotides). Examples of modified nucleotides that can be used to generate the nucleic acids include, but are not limited to, 5-fluorouracil, 5-bromouracil, 5-chlorouracil, 5-iodouracil, hypoxanthine, xanthine, 4-acetylcytosine, 5-(carboxyhydroxymethyl) uracil, 5-carboxymethylaminomethyl-2-thiouridine, 5-carboxymethylaminomethyluracil, dihydrouracil, beta-D-galactosylqueosine, inosine, N^{sup}.6-isopentenyladenine, 1-methylguanine, 1-methylinosine, 2,2-dimethylguanine, 2-methyladenine, 2-methylguanine, 3-methylcytosine, 5-methylcytosine, N^{sup}.6-substituted adenine, 7-methylguanine, 5-methylaminomethyluracil, 5-methoxyaminomethyl-2-thiouracil, beta-D-mannosylqueosine, 5'-methoxycarboxymethyluracil, 5-methoxyuracil, 2-methylthio-N^{sup}.6-isopentenyladenine, uracil-5-oxyacetic acid (v), wybutoxosine, pseudouracil, queosine, 2-thiocytosine, 5-methyl-2-thiouracil, 2-thiouracil, 4-thiouracil, 5-methyluracil, uracil-5-oxyacetic acid methylester, 3-(3-amino-3-N-2-carboxypropyl) uracil, and 2,6-diaminopurine. Alternatively, one or more of the nucleic acids of the invention can

be purchased from companies, such as Macromolecular Resources (Fort Collins, CO) and Synthesgen (Houston, TX).

[0085] The nucleic acid can comprise any nucleotide sequence which encodes any of the TCRs, polypeptides, or proteins described herein. In an embodiment of the invention, the nucleic acid may comprise the nucleotide sequences of any one of SEQ ID NOs: 42-45 (Table 5). In an embodiment of the invention, the nucleic acid comprises the nucleotide sequences of both of SEQ ID NOs: 42-43 or both of SEQ ID NOs: 44-45.

TABLE-US-00005 TABLE 5 TCR ID TCR chain Nucleotide sequence RAS.sup.G12V- Alpha SEQ ID NO: 42 HLA- (TRAV13-1) DRB1*07:01 Beta SEQ ID NO: 43 (TRBV20-1) RAS.sup.G12C- Alpha SEQ ID NO: 44 HLA- (TRAV24) DRB1*11:01 Beta SEQ ID NO: 45 (TRBV12-4)

[0086] In an embodiment of the invention, the nucleic acid comprises a codon-optimized nucleotide sequence encoding any of the TCRs, polypeptides, or proteins described herein. Without being bound to any particular theory or mechanism, it is believed that codon optimization of the nucleotide sequence increases the translation efficiency of the mRNA transcripts. Codon optimization of the nucleotide sequence may involve substituting a native codon for another codon that encodes the same amino acid, but can be translated by tRNA that is more readily available within a cell, thus increasing translation efficiency. Optimization of the nucleotide sequence may also reduce secondary mRNA structures that would interfere with translation, thus increasing translation efficiency.

[0087] The invention also provides a nucleic acid comprising a nucleotide sequence which is complementary to the nucleotide sequence of any of the nucleic acids described herein or a nucleotide sequence which hybridizes under stringent conditions to the nucleotide sequence of any of the nucleic acids described herein.

[0088] The nucleotide sequence which hybridizes under stringent conditions preferably hybridizes under high stringency conditions. By “high stringency conditions” is meant that the nucleotide sequence specifically hybridizes to a target sequence (the nucleotide sequence of any of the nucleic acids described herein) in an amount that is detectably stronger than non-specific hybridization. High stringency conditions include conditions which would distinguish a polynucleotide with an exact complementary sequence, or one containing only a few scattered mismatches from a random sequence that happened to have a few small regions (e.g., 3-10 bases) that matched the nucleotide sequence. Such small regions of complementarity are more easily melted than a full-length complement of 14-17 or more bases, and high stringency hybridization makes them easily distinguishable. Relatively high stringency conditions would include, for example, low salt and/or high temperature conditions, such as provided by about 0.02-0.1 M NaCl or the equivalent, at temperatures of about 50-70° C. Such high stringency conditions tolerate little, if any, mismatch between the nucleotide sequence and the template or target strand, and are particularly suitable for detecting expression of any of the inventive TCRs. It is generally appreciated that conditions can be rendered more stringent by the addition of increasing amounts of formamide.

[0089] The invention also provides a nucleic acid comprising a nucleotide sequence that is at least about 70% or more, e.g., about 80%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, or about 99% identical to any of the nucleic acids described herein. In this regard, the nucleic acid may consist essentially of any of the nucleotide sequences described herein.

[0090] The nucleic acids of the invention can be incorporated into a recombinant expression vector. In this regard, the invention provides a recombinant expression vector comprising any of the nucleic acids of the invention. In an embodiment of the invention, the recombinant expression vector comprises a nucleotide sequence encoding the α chain, the β chain, and linker peptide.

[0091] For purposes herein, the term “recombinant expression vector” means a genetically-modified oligonucleotide or polynucleotide construct that permits the expression of an mRNA, protein, polypeptide, or peptide by a host cell, when the construct comprises a nucleotide sequence

encoding the mRNA, protein, polypeptide, or peptide, and the vector is contacted with the cell under conditions sufficient to have the mRNA, protein, polypeptide, or peptide expressed within the cell. The vectors of the invention are not naturally-occurring as a whole. However, parts of the vectors can be naturally-occurring. The inventive recombinant expression vectors can comprise any type of nucleotide, including, but not limited to DNA and RNA, which can be single-stranded or double-stranded, synthesized or obtained in part from natural sources, and which can contain natural, non-natural or altered nucleotides. The recombinant expression vectors can comprise naturally-occurring, non-naturally-occurring internucleotide linkages, or both types of linkages. Preferably, the non-naturally occurring or altered nucleotides or internucleotide linkages do not hinder the transcription or replication of the vector.

[0092] The recombinant expression vector of the invention can be any suitable recombinant expression vector, and can be used to transform or transfect any suitable host cell. Suitable vectors include those designed for propagation and expansion or for expression or both, such as plasmids and viruses. The vector can be selected from the group consisting of the pUC series (Fermentas Life Sciences), the pBluescript series (Stratagene, LaJolla, CA), the pET series (Novagen, Madison, WI), the pGEX series (Pharmacia Biotech, Uppsala, Sweden), and the pEX series (Clontech, Palo Alto, CA). Bacteriophage vectors, such as λ GT10, λ GT11, λ ZapII (Stratagene), λ EMBL4, and λ NM1149, also can be used. Examples of plant expression vectors include pBI01, pBI101.2, pBI101.3, pBI121 and pBIN19 (Clontech). Examples of animal expression vectors include pEUK-Cl, pMAM and pMAMneo (Clontech). Preferably, the recombinant expression vector is a viral vector, e.g., a retroviral vector. In an especially preferred embodiment, the recombinant expression vector is an MSGV1 vector.

[0093] The recombinant expression vectors of the invention can be prepared using standard recombinant DNA techniques described in, for example, Green and Sambrook et al., supra. Constructs of expression vectors, which are circular or linear, can be prepared to contain a replication system functional in a prokaryotic or eukaryotic host cell. Replication systems can be derived, e.g., from ColEI, 2 μ plasmid, λ , SV40, bovine papillomavirus, and the like.

[0094] Desirably, the recombinant expression vector comprises regulatory sequences, such as transcription and translation initiation and termination codons, which are specific to the type of host cell (e.g., bacterium, fungus, plant, or animal) into which the vector is to be introduced, as appropriate and taking into consideration whether the vector is DNA- or RNA-based.

[0095] The recombinant expression vector can include one or more marker genes, which allow for selection of transformed or transfected host cells. Marker genes include biocide resistance, e.g., resistance to antibiotics, heavy metals, etc., complementation in an auxotrophic host cell to provide prototrophy, and the like. Suitable marker genes for the inventive expression vectors include, for instance, neomycin/G418 resistance genes, hygromycin resistance genes, histidinol resistance genes, tetracycline resistance genes, and ampicillin resistance genes.

[0096] The recombinant expression vector can comprise a native or nonnative promoter operably linked to the nucleotide sequence encoding the TCR, polypeptide, or protein, or to the nucleotide sequence which is complementary to or which hybridizes to the nucleotide sequence encoding the TCR, polypeptide, or protein. The selection of promoters, e.g., strong, weak, inducible, tissue-specific and developmental-specific, is within the ordinary skill of the artisan. Similarly, the combining of a nucleotide sequence with a promoter is also within the skill of the artisan. The promoter can be a non-viral promoter or a viral promoter, e.g., a cytomegalovirus (CMV) promoter, an SV40 promoter, an RSV promoter, and a promoter found in the long-terminal repeat of the murine stem cell virus.

[0097] The inventive recombinant expression vectors can be designed for either transient expression, for stable expression, or for both. Also, the recombinant expression vectors can be made for constitutive expression or for inducible expression.

[0098] Further, the recombinant expression vectors can be made to include a suicide gene. As used

herein, the term “suicide gene” refers to a gene that causes the cell expressing the suicide gene to die. The suicide gene can be a gene that confers sensitivity to an agent, e.g., a drug, upon the cell in which the gene is expressed, and causes the cell to die when the cell is contacted with or exposed to the agent. Suicide genes are known in the art and include, for example, the Herpes Simplex Virus (HSV) thymidine kinase (TK) gene, cytosine deaminase, purine nucleoside phosphorylase, nitroreductase, and the inducible caspase 9 gene system.

[0099] Another embodiment of the invention further provides a host cell comprising any of the recombinant expression vectors described herein. As used herein, the term “host cell” refers to any type of cell that can contain the inventive recombinant expression vector. The host cell can be a eukaryotic cell, e.g., plant, animal, fungi, or algae, or can be a prokaryotic cell, e.g., bacteria or protozoa. The host cell can be a cultured cell or a primary cell, i.e., isolated directly from an organism, e.g., a human. The host cell can be an adherent cell or a suspended cell, i.e., a cell that grows in suspension. Suitable host cells are known in the art and include, for instance, DH5 α *E. coli* cells, Chinese hamster ovarian cells, monkey VERO cells, COS cells, HEK293 cells, and the like. For purposes of amplifying or replicating the recombinant expression vector, the host cell is preferably a prokaryotic cell, e.g., a DH5 α cell. For purposes of producing a recombinant TCR, polypeptide, or protein, the host cell is preferably a mammalian cell. Most preferably, the host cell is a human cell. While the host cell can be of any cell type, can originate from any type of tissue, and can be of any developmental stage, the host cell preferably is a peripheral blood lymphocyte (PBL) or a peripheral blood mononuclear cell (PBMC). More preferably, the host cell is a T cell.

[0100] For purposes herein, the T cell can be any T cell, such as a cultured T cell, e.g., a primary T cell, or a T cell from a cultured T cell line, e.g., Jurkat, SupT1, etc., or a T cell obtained from a mammal. If obtained from a mammal, the T cell can be obtained from numerous sources, including but not limited to blood, bone marrow, lymph node, the thymus, or other tissues or fluids. T cells can also be enriched for or purified. Preferably, the T cell is a human T cell. The T cell can be any type of T cell and can be of any developmental stage, including but not limited to, CD4^{sup.}+ / CD8^{sup.}+ double positive T cells, CD4^{sup.}+ helper T cells, e.g., Th.sub.1 and Th.sub.2 cells, CD4^{sup.}+ T cells, CD8^{sup.}+ T cells (e.g., cytotoxic T cells), tumor infiltrating lymphocytes (TILs), memory T cells (e.g., central memory T cells and effector memory T cells), naïve T cells, and the like.

[0101] Also provided by the invention is a population of cells comprising at least one host cell described herein. The population of cells can be a heterogeneous population comprising the host cell comprising any of the recombinant expression vectors described, in addition to at least one other cell, e.g., a host cell (e.g., a T cell), which does not comprise any of the recombinant expression vectors, or a cell other than a T cell, e.g., a B cell, a macrophage, a neutrophil, an erythrocyte, a hepatocyte, an endothelial cell, an epithelial cells, a muscle cell, a brain cell, etc. Alternatively, the population of cells can be a substantially homogeneous population, in which the population comprises mainly of host cells (e.g., consisting essentially of) comprising the recombinant expression vector. The population also can be a clonal population of cells, in which all cells of the population are clones of a single host cell comprising a recombinant expression vector, such that all cells of the population comprise the recombinant expression vector. In one embodiment of the invention, the population of cells is a clonal population comprising host cells comprising a recombinant expression vector as described herein.

[0102] In an embodiment of the invention, the numbers of cells in the population may be rapidly expanded. Expansion of the numbers of T cells can be accomplished by any of a number of methods as are known in the art as described in, for example, U.S. Pat. Nos. 8,034,334; 8,383,099; U.S. Patent Application Publication No. 2012/0244133; Dudley et al., *J. Immunother.*, 26:332-42 (2003); and Riddell et al., *J. Immunol. Methods*, 128:189-201 (1990). In an embodiment, expansion of the numbers of T cells is carried out by culturing the T cells with OKT3 antibody, IL-2, and feeder PBMC (e.g., irradiated allogeneic PBMC).

[0103] The inventive TCRs, polypeptides, proteins, nucleic acids, recombinant expression vectors, and host cells (including populations thereof), can be isolated and/or purified. The term “isolated,” as used herein, means having been removed from its natural environment. The term “purified,” as used herein, means having been increased in purity, wherein “purity” is a relative term, and not to be necessarily construed as absolute purity. For example, the purity can be at least about 50%, can be greater than about 60%, about 70%, about 80%, about 90%, about 95%, or can be about 100%.

[0104] The inventive TCRs, polypeptides, proteins, nucleic acids, recombinant expression vectors, and host cells (including populations thereof), all of which are collectively referred to as “inventive TCR materials” hereinafter, can be formulated into a composition, such as a pharmaceutical composition. In this regard, the invention provides a pharmaceutical composition comprising any of the TCRs, polypeptides, proteins, nucleic acids, expression vectors, and host cells (including populations thereof), described herein, and a pharmaceutically acceptable carrier. The inventive pharmaceutical compositions containing any of the inventive TCR materials can comprise more than one inventive TCR material, e.g., a polypeptide and a nucleic acid, or two or more different TCRs. Alternatively, the pharmaceutical composition can comprise an inventive TCR material in combination with another pharmaceutically active agent(s) or drug(s), such as a chemotherapeutic agents, e.g., asparaginase, busulfan, carboplatin, cisplatin, daunorubicin, doxorubicin, fluorouracil, gemcitabine, hydroxyurea, methotrexate, paclitaxel, rituximab, vinblastine, vincristine, etc.

[0105] Preferably, the carrier is a pharmaceutically acceptable carrier. With respect to pharmaceutical compositions, the carrier can be any of those conventionally used for the particular inventive TCR material under consideration. Methods for preparing administrable compositions are known or apparent to those skilled in the art and are described in more detail in, for example, *Remington: The Science and Practice of Pharmacy*, 22nd Ed., Pharmaceutical Press (2012). It is preferred that the pharmaceutically acceptable carrier be one which has no detrimental side effects or toxicity under the conditions of use.

[0106] The choice of carrier will be determined in part by the particular inventive TCR material, as well as by the particular method used to administer the inventive TCR material. Accordingly, there are a variety of suitable formulations of the pharmaceutical composition of the invention. Suitable formulations may include any of those for parenteral, subcutaneous, intravenous, intramuscular, intraarterial, intrathecal, intratumoral, or interperitoneal administration. More than one route can be used to administer the inventive TCR materials, and in certain instances, a particular route can provide a more immediate and more effective response than another route.

[0107] Preferably, the inventive TCR material is administered by injection, e.g., intravenously. When the inventive TCR material is a host cell (or population thereof) expressing the inventive TCR, the pharmaceutically acceptable carrier for the cells for injection may include any isotonic carrier such as, for example, normal saline (about 0.90% w/v of NaCl in water, about 300 mOsm/L NaCl in water, or about 9.0 g NaCl per liter of water), NORMOSOL R electrolyte solution (Abbott, Chicago, IL), PLASMA-LYTE A (Baxter, Deerfield, IL), about 5% dextrose in water, or Ringer's lactate. In an embodiment, the pharmaceutically acceptable carrier is supplemented with human serum albumen.

[0108] For purposes of the invention, the amount or dose (e.g., numbers of cells when the inventive TCR material is one or more cells) of the inventive TCR material administered should be sufficient to effect, e.g., a therapeutic or prophylactic response, in the subject or animal over a reasonable time frame. For example, the dose of the inventive TCR material should be sufficient to bind to a cancer antigen (e.g., mutated RAS), or detect, treat or prevent cancer in a period of from about 2 hours or longer, e.g., 12 to 24 or more hours, from the time of administration. In certain embodiments, the time period could be even longer. The dose will be determined by the efficacy of the particular inventive TCR material and the condition of the animal (e.g., human), as well as the body weight of the animal (e.g., human) to be treated.

[0109] Many assays for determining an administered dose are known in the art. For purposes of the

invention, an assay, which comprises comparing the extent to which target cells are lysed or IFN- γ is secreted by T cells expressing the inventive TCR, polypeptide, or protein upon administration of a given dose of such T cells to a mammal among a set of mammals of which each is given a different dose of the T cells, could be used to determine a starting dose to be administered to a mammal. The extent to which target cells are lysed or IFN- γ is secreted upon administration of a certain dose can be assayed by methods known in the art.

[0110] The dose of the inventive TCR material also will be determined by the existence, nature and extent of any adverse side effects that might accompany the administration of a particular inventive TCR material. Typically, the attending physician will decide the dosage of the inventive TCR material with which to treat each individual patient, taking into consideration a variety of factors, such as age, body weight, general health, diet, sex, inventive TCR material to be administered, route of administration, and the severity of the cancer being treated. In an embodiment in which the inventive TCR material is a population of cells, the number of cells administered per infusion may vary, e.g., from about 1×10^6 to about 1×10^{12} cells or more. In certain embodiments, fewer than 1×10^6 cells may be administered.

[0111] One of ordinary skill in the art will readily appreciate that the inventive TCR materials of the invention can be modified in any number of ways, such that the therapeutic or prophylactic efficacy of the inventive TCR materials is increased through the modification. For instance, the inventive TCR materials can be conjugated either directly or indirectly through a bridge to a chemotherapeutic agent. The practice of conjugating compounds to a chemotherapeutic agent is known in the art. One of ordinary skill in the art recognizes that sites on the inventive TCR materials, which are not necessary for the function of the inventive TCR materials, are suitable sites for attaching a bridge and/or a chemotherapeutic agent, provided that the bridge and/or chemotherapeutic agent, once attached to the inventive TCR materials, do(es) not interfere with the function of the inventive TCR materials, i.e., the ability to bind to mutated RAS or to detect, treat, or prevent cancer.

[0112] It is contemplated that the inventive pharmaceutical compositions, TCRs, polypeptides, proteins, nucleic acids, recombinant expression vectors, host cells, and populations of cells can be used in methods of treating or preventing cancer. Without being bound to a particular theory, the inventive TCRs are believed to bind specifically to mutated RAS, such that the TCR (or related inventive polypeptide or protein), when expressed by a cell, is able to mediate an immune response against a target cell expressing mutated RAS. In this regard, the invention provides a method of treating or preventing cancer in a mammal, comprising administering to the mammal any of the pharmaceutical compositions, TCRs, polypeptides, or proteins described herein, any nucleic acid or recombinant expression vector comprising a nucleotide sequence encoding any of the TCRs, polypeptides, proteins described herein, or any host cell or population of cells comprising a recombinant vector which encodes any of the TCRs, polypeptides, or proteins described herein, in an amount effective to treat or prevent cancer in the mammal.

[0113] An embodiment of the invention provides any of the pharmaceutical compositions, TCRs, polypeptides, or proteins described herein, any nucleic acid or recombinant expression vector comprising a nucleotide sequence encoding any of the TCRs, polypeptides, proteins described herein, or any host cell or population of cells comprising a recombinant vector which encodes any of the TCRs, polypeptides, or proteins described herein, for use in the treatment or prevention of cancer in a mammal.

[0114] The terms “treat,” and “prevent” as well as words stemming therefrom, as used herein, do not necessarily imply 100% or complete treatment or prevention. Rather, there are varying degrees of treatment or prevention of which one of ordinary skill in the art recognizes as having a potential benefit or therapeutic effect. In this respect, the inventive methods can provide any amount of any level of treatment or prevention of cancer in a mammal. Furthermore, the treatment or prevention provided by the inventive method can include treatment or prevention of one or more conditions or

symptoms of the cancer being treated or prevented. For example, treatment or prevention can include promoting the regression of a tumor. Also, for purposes herein, “prevention” can encompass delaying the onset of the cancer, or a symptom or condition thereof. Alternatively or additionally, “prevention” may encompass preventing or delaying the recurrence of cancer, or a symptom or condition thereof.

[0115] Also provided is a method of detecting the presence of cancer in a mammal. The method comprises (i) contacting a sample comprising one or more cells from the mammal with any of the inventive TCRs, polypeptides, proteins, nucleic acids, recombinant expression vectors, host cells, populations of cells, or pharmaceutical compositions described herein, thereby forming a complex, and detecting the complex, wherein detection of the complex is indicative of the presence of cancer in the mammal.

[0116] With respect to the inventive method of detecting cancer in a mammal, the sample of cells can be a sample comprising whole cells, lysates thereof, or a fraction of the whole cell lysates, e.g., a nuclear or cytoplasmic fraction, a whole protein fraction, or a nucleic acid fraction.

[0117] For purposes of the inventive method of detecting cancer, the contacting can take place in vitro or in vivo with respect to the mammal. Preferably, the contacting is in vitro.

[0118] Also, detection of the complex can occur through any number of ways known in the art. For instance, the inventive TCRs, polypeptides, proteins, nucleic acids, recombinant expression vectors, host cells, or populations of cells, described herein, can be labeled with a detectable label such as, for instance, a radioisotope, a fluorophore (e.g., fluorescein isothiocyanate (FITC), phycoerythrin (PE)), an enzyme (e.g., alkaline phosphatase, horseradish peroxidase), and element particles (e.g., gold particles).

[0119] For purposes of the inventive methods, wherein host cells or populations of cells are administered, the cells can be cells that are allogeneic or autologous to the mammal. Preferably, the cells are autologous to the mammal.

[0120] With respect to the inventive methods, the cancer can be any cancer, including any of acute lymphocytic cancer, acute myeloid leukemia, alveolar rhabdomyosarcoma, bone cancer, brain cancer, breast cancer, cancer of the anus, anal canal, or anorectum, cancer of the eye, cancer of the intrahepatic bile duct, cancer of the joints, cancer of the neck, gallbladder, or pleura, cancer of the nose, nasal cavity, or middle ear, cancer of the oral cavity, cancer of the vagina, cancer of the vulva, chronic lymphocytic leukemia, chronic myeloid cancer, colon cancer, colorectal cancer, endometrial cancer, esophageal cancer, uterine cervical cancer, gastrointestinal carcinoid tumor, glioma, Hodgkin lymphoma, hypopharynx cancer, kidney cancer, larynx cancer, liver cancer, lung cancer, malignant mesothelioma, melanoma, multiple myeloma, nasopharynx cancer, non-Hodgkin lymphoma, cancer of the oropharynx, ovarian cancer, cancer of the penis, pancreatic cancer, peritoneum, omentum, and mesentery cancer, pharynx cancer, prostate cancer, rectal cancer, renal cancer, skin cancer, small intestine cancer, soft tissue cancer, stomach cancer, testicular cancer, thyroid cancer, cancer of the uterus, ureter cancer, and urinary bladder cancer. A preferred cancer is pancreatic, colorectal, lung, endometrial, ovarian, or prostate cancer. Preferably, the lung cancer is lung adenocarcinoma, the ovarian cancer is epithelial ovarian cancer, and the pancreatic cancer is pancreatic adenocarcinoma. In an embodiment of the invention, the cancer expresses a mutated human RAS amino acid sequence, wherein the mutated human RAS amino acid sequence is a mutated human KRAS, a mutated human HRAS, or a mutated human NRAS amino acid sequence. The mutated human KRAS, mutated human HRAS, and mutated human NRAS expressed by the cancer may be as described herein with respect to other aspects of the invention.

[0121] The mammal referred to in the inventive methods can be any mammal. As used herein, the term “mammal” refers to any mammal, including, but not limited to, mammals of the order Rodentia, such as mice and hamsters, and mammals of the order Logomorpha, such as rabbits. It is preferred that the mammals are from the order Camivora, including Felines (cats) and Canines (dogs). It is more preferred that the mammals are from the order Artiodactyla, including Bovines

(cows) and Swines (pigs) or of the order Perssodactyla, including Equines (horses). It is most preferred that the mammals are of the order Primates, Ceboids, or Simoids (monkeys) or of the order Anthropoids (humans and apes). An especially preferred mammal is the human.

[0122] The following examples further illustrate the invention but, of course, should not be construed as in any way limiting its scope.

Example 1

[0123] This example demonstrates the isolation of a TCR having antigenic specificity for human KRAS with the G12V mutation presented by an HLA-DRB1*07:01 molecule.

[0124] A TCR with antigenic specificity for human KRAS with the G12V mutation presented by an HLA-DRB1*07:01 molecule was isolated from an endometrial tumor sample from a patient. Briefly, the tumor sample was minced, digested, and frozen. Prior to cell sorting, the tumor digest was thawed and rested overnight without cytokines. T cells were sorted from the tumor digest based on PD-1 and/or OX40 expression (Gated on PI.sup.– (live cells)>CD3+) using FACS. The FACS results are shown in FIG. 1. Cells stained for isotype served as a control.

[0125] The numbers of sorted cells were expanded in accordance with the rapid expansion protocol (REP) for 3.5 weeks. For REP, the T cells were cultured in microtiter 96-well plates (3 cells/well) in the presence of OKT3 antibody, IL-2, and irradiated allogeneic PBMC.

[0126] The expanded numbers of cells were pooled and tested for reactivity against autologous dendritic cells (DC) pulsed with pooled 25-mer peptides or peptides encoded by 25-mer tandem minigenes (TMGs) encompassing various tumor-specific mutations which were detected in the patient's tumor. Each pool contained 17-21 peptides or TMGs each. Interferon-gamma (IFN-γ) secretion was measured by Enzyme-Linked ImmunoSpot (ELISPOT). The results are shown in FIG. 2. As shown in FIG. 2, pooled effector autologous T cells in culture numbers 7 and 8 recognized target DCs pulsed with peptide pool 1 (PP1) and peptide pool 2 (PP2).

[0127] Mutation-reactive T cell cultures were tested against autologous DCs pulsed with each single peptide from the relevant peptide pool. FIG. 3 shows the results obtained upon co-culture of autologous T cell culture number 7 (W7) with autologous DCs pulsed with each of peptides 1-17 (P1-P17) from peptide pool 1 (PP1). As shown in FIG. 3, the T cells of culture number 7 showed high specificity against peptide P17. Peptide 17 (P17) encodes for KRAS.sup.G12V mutation.

[0128] Total RNA was isolated from the cells of autologous T cell culture number 7 (W7). The total RNA then underwent rapid amplification of 5' complementary DNA ends (5' RACE) using TCR-alpha and -beta chain constant primers. The TCR PCR products were then isolated by standard agarose gel electrophoresis and gel extraction. The product was directly sequenced. The nucleotide sequences of the TCR alpha and beta chain variable regions were SEQ ID NO: 42 and 43, respectively. The amino acid sequences of the TCR alpha and beta chain variable regions are shown in Table 6. The complementarity determining regions (CDRs) are underlined.

Example 2

[0129] This example demonstrates that the TCR isolated in Example 1 recognizes KRAS G12V peptide antigen presented in the context of an HLA-DR molecule.

[0130] A nucleic acid sequence encoding the isolated G12V-reactive TCR of Example 1 (comprising the nucleotide sequences of SEQ ID NO: 42 and SEQ ID NO: 43) and including a

cysteine substituted, LVL-modified murine constant region was cloned into a retroviral expression vector. The α chain murine constant region comprised the amino acid sequence of SEQ ID NO: 30 wherein X at position 48 is Cys, X at position 112 is Leu, X at position 114 is Ile, and X at position 115 is Val. The β chain constant region comprised the amino acid sequence of SEQ ID NO: 31, wherein X at position 57 is Cys. A linker comprising the amino acid sequence of SEQ ID NO: 54 was positioned between the α chain constant region and the β chain variable region. Allogenic T cells were transduced with the retroviral expression vector.

[0131] The transduced cells (effector cells) were co-cultured with target autologous antigen presenting cells (APCs) pulsed with KRAS.sup.G12V peptide (1 ng/mL) with HLA-blocking antibody W6/32 (anti-HLA-A, -B, -C), IVA12 (pan-specific, anti-HLA Class II), B7/21 (anti-HLA-DP), HB55 (anti-HLA-DR), or SPV-L3 (HLA-DQ) (target cell). Effector transduced cells cultured alone, with DMSO, or phorbol myristate acetate (PMA) served as controls. Effector cells transduced with an empty vector (mock) co-cultured with target autologous APCs pulsed with 1 ng/mL KRAS G12V peptide (SEQ ID NO: 53) served as still another control.

[0132] The reactivity of the effector cells against the target cells was measured by 4-1BB expression detected by flow cytometry (gated on CD3+ mTCR beta chain+ cells). The results are shown in FIG. 4. As shown in FIG. 4, the IVA12 and HB55 antibodies blocked reactivity of the effector cells against the target cells, indicating that the transduced effector cells recognized KRAS G12V peptide antigen presented in the context of an HLA-DR molecule.

Example 3

[0133] This example demonstrates that the TCR of Example 2 recognizes KRAS G12V peptide antigen presented in the context of an HLA-DRB1*07:01 molecule.

[0134] Allogeneic T cells transduced with the TCR of Example 2 (effector cells) were co-cultured with APCs autologous to the patient of Example 1 or APCs from donors with a DRB1 01:01 or DRB1 07:01 haplotype (target cells). Target cells were pulsed with KRAS.sup.G12V peptide (SEQ ID NO: 53) or WT KRAS peptide (SEQ ID NO: 55). Effector cells were co-cultured with APCs from a HLA-DRB1 positive donor (wherein one, but not both, of the donor's alleles is DRB1*07:01) ("DRB mismatch") as a control. Effector cells cultured alone, with DMSO, or with PMA-ionomycin served as further controls. IFN- γ secretion was measured by ELISPOT. The numbers of positive wells were counted. The results are shown in Table 7 and FIG. 5. In Table 7, "TNTC" stands for "too numerous to count." The percentage of mTCR-expressing cells which express 4-1BB was also measured by flow cytometry. The results are shown in FIG. 5. The results show that the TCR is reactive specifically against mutated KRAS presented by HLA-DRB*07:01.

TABLE-US-00007

Example 4

[0135] This example demonstrates the isolation of a TCR having antigenic specificity for human KRAS with the G12C mutation presented by an HLA-DRB1*11:01 molecule.

[0136] A KRAS.sup.G12C reactive TCR was identified using repeated in-vitro sensitization (IVS) of peripheral blood T cell subsets from an ovarian cancer patient with a KRAS.sup.G12C-expressing tumor.

[0137] Autologous DCs were pulsed with a G12C mutated peptide (SEQ ID NO: 56) and co-cultured with sorted T cells subsets for 10 days and then the reactivity was tested, as described in Example 1.

[0138] To enrich the reactive cells further, the reactive fraction against KRAS mutated peptide was sorted based on 4-1BB/OX40 expression and stimulated again with the mutated peptide. The reactive T cells were sorted based on 4-1BB/OX40 expression and sequenced.

[0139] Total RNA was isolated from the cells. The total RNA then underwent rapid amplification of 5' complementary DNA ends (5' RACE) using TCR-alpha and -beta chain constant primers. The

TCR PCR products were then isolated by standard agarose gel electrophoresis and gel extraction. The product was directly sequenced. The nucleotide sequences of the TCR alpha and beta chain variable regions were SEQ ID NO: 44 and 45, respectively. The amino acid sequences of the TCR alpha and beta chain variable regions are shown in Table 8. The complementarity determining regions (CDRs) are underlined.

Example 5

[0140] This example demonstrates that the TCR isolated in Example 4 recognizes KRAS G12C peptide antigen presented in the context of an HLA-DR molecule.

[0141] A nucleic acid sequence encoding the isolated G12C-reactive TCR of Example 4 (comprising the nucleotide sequences of SEQ ID NO: 44 and SEQ ID NO: 45) and including a cysteine substituted, LVL-modified murine constant region was cloned into a retroviral expression vector. The α chain murine constant region comprised the amino acid sequence of SEQ ID NO: 30 wherein X at position 48 is Cys, X at position 112 is Leu, X at position 114 is Ile, and X at position 115 is Val. The β chain constant region comprised the amino acid sequence of SEQ ID NO: 31, wherein X at position 57 is Cys. A linker comprising the amino acid sequence of SEQ ID NO: 54 was positioned between the α chain constant region and the β chain variable region. Allogenic T cells were transduced with the retroviral expression vector.

[0142] The transduced cells (effector cells) were co-cultured with target autologous DCs or allogeneic DCs matching with single HLA-DRB15:01 or HLA-DRB11:01 alleles pulsed with KRAS.sup.G12C 24-mer peptide (SEQ ID NO: 56) following blocking of their membrane MHC Class II molecules using antibodies against HLA-DQ, HLA-DR, or HLA-DP, or a pan-specific antibody against all of HLA-DP, HLA-DR, and HLA-DQ. Effector transduced cells cultured with phorbol myristate acetate (PMA) or WT KRAS (SEQ ID NO: 55) served as controls.

[0143] The reactivity of the effector cells against the target cells was measured by 4-1BB expression detected by flow cytometry (gated on CD3+ mTCR beta chain+ cells). The results are shown in FIG. 10. As shown in FIG. 10, the TCR is reactive specifically against KRAS.sup.G12C presented by HLA-DRB*11:01.

Example 6

[0144] This example demonstrates that PBMC transduced with the KRAS.sup.G12C TCR of Example 5 recognizes autologous DCs pulsed with KRAS.sup.G12C peptides.

[0145] Allogenic T cells were genetically engineered with MSGV-1-retrovirus encoding the KRAS.sup.G12C TCR of Example 5. Autologous DCs were loaded with WT KRAS (SEQ ID NO: 55) or KRAS.sup.G12C peptide (SEQ ID NO: 56) and co-cultured with the TCR transduced cells for 18 hours followed by flow cytometry analysis for 4-1BB upregulation. The results are shown in FIG. 9. As shown in FIG. 9, PBMC transduced with the KRAS.sup.G12C TCR of Example 5 recognized autologous DCs pulsed with KRAS.sup.G12C peptide.

Example 7

[0146] This example demonstrates that the KRAS G12V mutated protein is processed and presented by DC and recognized by the TCR of Example 2.

[0147] Allogenic T cells transduced with the G12V-DRB1*07:01 of Example 2 were co-cultured

overnight with autologous DCs pulsed with cell lysates of tumor cell lines expressing one of the following KRAS G12 mutations: G12R, G12C, G12D, or G12V. Transduced cells co-cultured with autologous DCs pulsed with cell lysate of a tumor cell line which expresses WT KRAS served as a control. Transduced cells cultured alone or with PMA or DMSO served as further controls. The percentage of cells upregulating 4-1BB and/or OX40 was measured by flow cytometry. The number of cells expressing IFN γ (spots per 2 \times 10⁴ cells) was measured by ELISPOT. The results are shown in FIG. 6. As shown in FIG. 6, the KRAS G12V mutated protein is processed and presented by DC and recognized by the TCR of Example 2.

Example 8

[0148] This example demonstrates that cells transduced with the G12V-DRB1*07:01 TCR of Example 2 specifically recognize the KRAS.sup.G12V peptide.

[0149] Allogenic T cells transduced with the G12V-DRB1*07:01 TCR of Example 2 were co-cultured overnight with autologous DCs pulsed with 24-mer peptides KRAS.sup.G12V (SEQ ID NO: 53) or WT KRAS (SEQ ID NO: 55) in various concentrations. The percentage of mTCR β +CD8+4-1BB+ cells was measured by flow cytometry. The results are shown in FIG. 7. As shown in FIG. 7, cells transduced with the G12V-DRB1*07:01 TCR of Example 2 specifically recognized the KRAS.sup.G12V peptide.

Example 9

[0150] cells transduced with the G12V-DRB1*07:01 TCR of Example 2 specifically recognize a variety of KRAS.sup.G12V peptides.

[0151] Allogenic T cells transduced with the G12V-DRB1*07:01 TCR of Example 2 were co-cultured overnight with autologous DCs pulsed with the peptides listed in Table 9 below in various concentrations. IFN γ secretion was measured by ELISPOT. The results are shown in FIG. 8. As shown in FIG. 8, while the cells transduced with the G12V-DRB1*07:01 TCR of Example 2 specifically recognized all of the KRAS.sup.G12V peptides, SEQ ID NO: 52 was the best.

[0152] All references, including publications, patent applications, and patents, cited herein are hereby incorporated by reference to the same extent as if each reference were individually and specifically indicated to be incorporated by reference and were set forth in its entirety herein.

[0153] The use of the terms “a” and “an” and “the” and “at least one” and similar referents in the context of describing the invention (especially in the context of the following claims) are to be construed to cover both the singular and the plural, unless otherwise indicated herein or clearly contradicted by context. The use of the term “at least one” followed by a list of one or more items (for example, “at least one of A and B”) is to be construed to mean one item selected from the listed items (A or B) or any combination of two or more of the listed items (A and B), unless otherwise indicated herein or clearly contradicted by context. The terms “comprising,” “having,” “including,” and “containing” are to be construed as open-ended terms (i.e., meaning “including, but not limited to,”) unless otherwise noted. Recitation of ranges of values herein are merely intended to serve as a shorthand method of referring individually to each separate value falling within the range, unless otherwise indicated herein, and each separate value is incorporated into the specification as if it were individually recited herein. All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or exemplary language (e.g., “such as”) provided herein, is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention unless otherwise claimed. No language in the specification should be construed as indicating any non-

claimed element as essential to the practice of the invention.

[0154] Preferred embodiments of this invention are described herein, including the best mode known to the inventors for carrying out the invention. Variations of those preferred embodiments may become apparent to those of ordinary skill in the art upon reading the foregoing description. The inventors expect skilled artisans to employ such variations as appropriate, and the inventors intend for the invention to be practiced otherwise than as specifically described herein. Accordingly, this invention includes all modifications and equivalents of the subject matter recited in the claims appended hereto as permitted by applicable law. Moreover, any combination of the above-described elements in all possible variations thereof is encompassed by the invention unless otherwise indicated herein or otherwise clearly contradicted by context.

Claims

1. A method of treating or preventing cancer in a mammal, comprising administering to the mammal: (i) a T-cell receptor (TCR); (ii) a nucleic acid comprising a nucleotide sequence encoding the TCR; (iii) a recombinant expression vector comprising the nucleic acid; (iv) a host cell comprising the recombinant expression vector; (v) a population of cells comprising the host cell; or (vi) a pharmaceutical composition comprising (a) the TCR, nucleic acid, recombinant expression vector, host cell, or population of cells; and (b) a pharmaceutically acceptable carrier; in an amount effective to treat or prevent cancer in the mammal, wherein the TCR has antigenic specificity for a mutated human RAS amino acid sequence presented by a human leukocyte antigen (HLA) Class II molecule, wherein the mutated human RAS amino acid sequence is a mutated human Kirsten rat sarcoma viral oncogene homolog (KRAS), a mutated human Harvey rat sarcoma viral oncogene homolog (HRAS), or a mutated human Neuroblastoma rat sarcoma viral oncogene homolog (NRAS) amino acid sequence, and wherein the TCR comprises: an α chain complementarity determining region (CDR) 1 comprising the amino acid sequence of SEQ ID NO: 7, an α chain CDR2 comprising the amino acid sequence of SEQ ID NO: 8, an α chain CDR3 comprising the amino acid sequence of SEQ ID NO: 9, a β chain CDR1 comprising the amino acid sequence of SEQ ID NO: 10, a β chain CDR2 comprising the amino acid sequence of SEQ ID NO: 11, and a β chain CDR3 comprising the amino acid sequence of SEQ ID NO: 12.
2. The method according to claim 1, wherein the HLA Class II molecule is an HLA-DR molecule.
3. The method according to claim 1, wherein the HLA Class II molecule is an HLA-DRB1 molecule.
4. The method according to claim 1, wherein the HLA Class II molecule is an HLA-DRB1*11:01 molecule.
5. The method according to claim 1, wherein the mutated human RAS amino acid sequence comprises a wild-type human KRAS, a wild-type human HRAS, or a wild-type human NRAS amino acid sequence with a substitution of glycine at position 12, wherein position 12 is defined by reference to the wild-type human KRAS, wild-type human HRAS, or wild-type human NRAS protein, respectively.
6. The method according to claim 5, wherein the substitution is a substitution of glycine at position 12 with cysteine.
7. The method according to claim 1, wherein the TCR comprises: (i) an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 15, (ii) an amino acid sequence at least 95% identical to the amino acid sequence SEQ ID NO: 16, (iii) an amino acid sequence at least 95% identical to amino acids 23-132 of SEQ ID NO: 15, (iv) an amino acid sequence at least 95% identical to amino acids 22-137 of SEQ ID NO: 16; or (v) both of (i) and (ii), both of (iii) and (iv), both of (i) and (iv), or both of (ii) and (iii).
8. The method of claim 1, wherein the TCR further comprises: (a) an α chain constant region comprising an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID

NO: 30, wherein: (i) X at position 48 of SEQ ID NO: 30 is Thr or Cys; (ii) X at position 112 of SEQ ID NO: 30 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 114 of SEQ ID NO: 30 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 115 of SEQ ID NO: 30 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) a β chain constant region comprising an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 31, wherein X at position 57 of SEQ ID NO: 31 is Ser or Cys; or (c) both (a) and (b).

9. The method of claim 1, wherein the TCR comprises: (a) an α chain comprising an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) a β chain comprising an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; or (c) both (a) and (b).

10. A method of treating or preventing cancer in a mammal, comprising administering to the mammal: (i) a polypeptide; (ii) a nucleic acid comprising a nucleotide sequence encoding the polypeptide; (iii) a recombinant expression vector comprising the nucleic acid; (iv) a host cell comprising the recombinant expression vector; (v) a population of cells comprising the host cell; or (vi) a pharmaceutical composition comprising (a) the polypeptide, nucleic acid, recombinant expression vector, host cell, or population of cells; and (b) a pharmaceutically acceptable carrier; in an amount effective to treat or prevent cancer in the mammal, wherein the polypeptide comprises a functional portion of a T cell receptor (TCR), and wherein the functional portion comprises an α chain CDR1 comprising the amino acid sequence of SEQ ID NO: 7, an α chain CDR2 comprising the amino acid sequence of SEQ ID NO: 8, an α chain CDR3 comprising the amino acid sequence of SEQ ID NO: 9, a β chain CDR1 comprising the amino acid sequence of SEQ ID NO: 10, a β chain CDR2 comprising the amino acid sequence of SEQ ID NO: 11, and a β chain CDR3 comprising the amino acid sequence of SEQ ID NO: 12.

11. The method according to claim 10, wherein the functional portion comprises the amino acid sequence(s) of: (i) SEQ ID NO: 15, (ii) SEQ ID NO: 16, (iii) amino acids 23-132 of SEQ ID NO: 15; (iv) amino acids 22-137 of SEQ ID NO: 16; or (v) both of (i) and (ii), both of (iii) and (iv), both of (i) and (iv), or both of (ii) and (iii).

12. The method of claim 10, wherein the functional portion further comprises: (a) an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 30, wherein: (i) X at position 48 of SEQ ID NO: 30 is Thr or Cys; (ii) X at position 112 of SEQ ID NO: 30 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 114 of SEQ ID NO: 30 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 115 of SEQ ID NO: 30 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 31, wherein X at position 57 of SEQ ID NO: 31 is Ser or Cys; or (c) both (a) and (b).

13. The method of claim 10, wherein the functional portion comprises: (a) an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; or (c) both (a) and (b).

14. A method of treating or preventing cancer in a mammal, comprising administering to the mammal: (i) a protein; (ii) a nucleic acid comprising a nucleotide sequence encoding the protein; (iii) a recombinant expression vector comprising the nucleic acid; (iv) a host cell comprising the recombinant expression vector; (v) a population of cells comprising the host cell; or (vi) a pharmaceutical composition comprising (a) the protein, nucleic acid, recombinant expression

vector, host cell, or population of cells; and (b) a pharmaceutically acceptable carrier; in an amount effective to treat or prevent cancer in the mammal, wherein the protein comprises a first polypeptide chain comprising an α chain CDR1 comprising the amino acid sequence of SEQ ID NO: 7, an α chain CDR2 comprising the amino acid sequence of SEQ ID NO: 8, and an α chain CDR3 comprising the amino acid sequence of SEQ ID NO: 9, and a second polypeptide chain comprising a β chain CDR1 comprising the amino acid sequence of SEQ ID NO: 10, a β chain CDR2 comprising the amino acid sequence of SEQ ID NO: 11, and a β chain CDR3 comprising the amino acid sequence of SEQ ID NO: 12.

15. The method according to claim 14, wherein: (i) the first polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 15, and the second polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 16; (ii) the first polypeptide chain comprises an amino acid sequence at least 95% identical to amino acids 23-132 of SEQ ID NO: 15, and the second polypeptide chain comprises an amino acid sequence at least 95% identical to amino acids 22-137 of SEQ ID NO: 16; (iii) the first polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 15, and the second polypeptide chain comprises an amino acid sequence at least 95% identical to amino acids 22-137 of SEQ ID NO: 16; (iv) the first polypeptide chain comprises an amino acid sequence at least 95% identical to amino acids 23-132 of SEQ ID NO: 15, and the second polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 16; (v) the first polypeptide chain comprises the amino acid sequence of SEQ ID NO: 15, and the second polypeptide chain comprises the amino acid sequence of SEQ ID NO: 16; (vi) the first polypeptide chain comprises the amino acid sequence of SEQ ID NO: 15, and the second polypeptide chain comprises an amino acid sequence at least 95% identical to amino acids 22-137 of SEQ ID NO: 16 or an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 16; or (vii) the first polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 15 or an amino acid sequence at least 95% identical to amino acids 23-132 of SEQ ID NO: 15, and the second polypeptide chain comprises the amino acid sequence of SEQ ID NO: 16.

16. The method of claim 14, wherein: (a) the first polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 30, wherein: (i) X at position 48 of SEQ ID NO: 30 is Thr or Cys; (ii) X at position 112 of SEQ ID NO: 30 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 114 of SEQ ID NO: 30 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 115 of SEQ ID NO: 30 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) the second polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 31, wherein X at position 57 of SEQ ID NO: 31 is Ser or Cys; or (c) both (a) and (b).

17. The method of claim 14, wherein: (a) the first polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 36, wherein: (i) X at position 180 of SEQ ID NO: 36 is Thr or Cys; (ii) X at position 244 of SEQ ID NO: 36 is Ser, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (iii) X at position 246 of SEQ ID NO: 36 is Met, Ala, Val, Leu, Ile, Pro, Phe, or Trp; and (iv) X at position 247 of SEQ ID NO: 36 is Gly, Ala, Val, Leu, Ile, Pro, Phe, Met, or Trp; (b) the second polypeptide chain comprises an amino acid sequence at least 95% identical to the amino acid sequence of SEQ ID NO: 37, wherein X at position 194 of SEQ ID NO: 37 is Ser or Cys; or (c) both (a) and (b).

18. The method according to claim 1, wherein the cancer is pancreatic, colorectal, lung, endometrial, ovarian, or prostate cancer.

19. The method according to claim 10, wherein the cancer is pancreatic, colorectal, lung, endometrial, ovarian, or prostate cancer.

20. The method according to claim 14, wherein the cancer is pancreatic, colorectal, lung, endometrial, ovarian, or prostate cancer.
