United States Patent	12384639
Kind Code	B2
Date of Patent	August 12, 2025
Inventor(s)	Guenther; Catrina et al.

Roll-up device and wrapping system

Abstract

A wrapping or roll-up device including a base, one or more connectors, an arm, and a handle. In embodiments, one or more connectors are connected to the base and are configured to connect the device to a wall or support structure, and/or the arm includes an aperture. In embodiments, a handle includes an extended portion and a grip portion, and at least a portion of the extended portion is configured to extend through the aperture. Further, with embodiments, the extended portion includes a slot disposed about an end of the extended portion. Embodiments may include a tensioner. Methods for wrapping or rolling up an article such as a wrap are also disclosed.

International Preliminary Report on Patentability dated May 16, 2023, PCT/US2021/60274. cited by applicant

Primary Examiner: Rivera; William A.

Background/Summary

CROSS-REFERENCE TO RELATED APPLICATIONS (1) This application is a National Stage Patent Application of International Patent Application No. PCT/US21/60274, filed Nov. 21, 2021, which claims the benefit of priority to U.S. Provisional Patent Application No. 63/129,180, filed Dec. 22, 2020 and U.S. Provisional Patent Application No. 63/117,199, filed Nov. 23, 2020, the contents of all of the foregoing being incorporated by reference in their entireties.

TECHNICAL FIELD

(1) The present disclosure generally relates to roll-up devices and wrapping systems, including devices and systems for rolling up or re-wrapping straps.

BACKGROUND

(2) This background description is set forth below for the purpose of providing context only. Therefore, any aspect of this background description, to the extent that it does not otherwise qualify as prior art, is neither expressly nor impliedly admitted as prior art against the instant disclosure.

(3) In industries, including medical and equestrian industries, articles or items, such as wraps, may be used or otherwise become unraveled. For example, wraps may be used to wrap a horse's leg for riding. When finished, such wraps may need to be re-wound. However, such rewinding may be messy, as the wraps may pick up hay, dust, or other debris, and time consuming, as the wraps may be lengthy and can take time to fully roll up. Moreover, as horses are moved or exist in a number of locations, it is beneficial to provide a device that can readily be moved or repositioned for use or storage.

(4) For at least these reasons, there is a desire for a wrapping or roll-up device that address some or all of the existing challenges and/or provided added benefits.

SUMMARY

(5) A wrapping or roll-up device including a base, one or more connectors, an arm, and a handle. In embodiments, one or more connectors are connected to the base and are configured to connect the device to a wall or support structure, and/or the arm includes an aperture. In embodiments, a handle includes an extended portion and a grip portion, and at least a portion of the extended portion is configured to extend through the aperture. Further, with embodiments, the extended portion includes a slot disposed about an end of the extended portion.

(6) The foregoing and other aspects, features, details, utilities, and/or advantages of embodiments of the present disclosure will be apparent from reading the following description, and from reviewing the accompanying drawings.

Description

BRIEF DESCRIPTION OF THE DRAWINGS

- (1) FIG. 1 is a perspective view of an embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (2) FIG. 2 is a side view of a portion of an embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (3) FIG. 3 is a perspective view of a handle for a wrapping or roll-up device according to aspects or teachings of the present disclosure;
- (4) FIG. 4 is a perspective view of an embodiment of a holder for a wrapping or roll-up device according to aspects or teachings of the present disclosure;
- (5) FIG. 5 is a perspective view of another embodiment of a holder for a wrapping or roll-up device according to aspects or teachings of the present disclosure;
- (6) FIG. 6 is a perspective view of another embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (7) FIG. 7 is a perspective view of yet another embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (8) FIG. 8 is a perspective view of still another embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (9) FIG. 9 is a perspective view of an embodiment of a wrapping or roll-up device, similar to that shown in FIG. 8, and shown in an open position/configuration.
- (10) FIG. 10 is a front-top-side perspective view of an embodiment of a wrapping or roll-up device according to aspects or teachings of the present disclosure.
- (11) FIG. 11 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (12) FIG. 12 is a front-top perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (13) FIG. 13 is a front-top perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (14) FIG. 14 is a side-top-rear perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (15) FIG. 15 is a rear-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (16) FIG. 16 is a bottom-front-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10.
- (17) FIG. 17 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 10, shown connected to a horizontal board.
- (18) FIG. 18 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 17 with a portion of a wrap inserted through the slot of the handle.
- (19) FIG. 19 is another front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 17 with a portion of a wrap inserted through the slot of the handle.
- (20) FIG. 20 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 17 with a partially rolled wrap.
- (21) FIG. 21 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 17 with substantially rolled up wrap.
- (22) FIG. 22 is a front-top-side perspective view of the embodiment of a wrapping or roll-up device shown in FIG. 17 with a rolled wrap removed from the device.

DETAILED DESCRIPTION

(23) Reference will now be made in detail to embodiments of the present disclosure, examples of which are described herein and illustrated in the accompanying drawings. While the present disclosure will be described in conjunction with embodiments and/or examples, it will be

understood that they do not limit the present disclosure to these embodiments and/or examples. On the contrary, the present disclosure covers alternatives, modifications, and equivalents.

(24) Various embodiments are described herein for various apparatuses, systems, and/or methods. Numerous specific details are set forth to provide a thorough understanding of the overall structure, function, manufacture, and use of the embodiments as described in the specification and illustrated in the accompanying drawings. It will be understood by those skilled in the art, however, that the embodiments may be practiced without such specific details. In other instances, well-known operations, components, and elements have not been described in detail so as not to obscure the embodiments described in the specification. Those of ordinary skill in the art will understand that the embodiments described and illustrated herein are non-limiting examples, and thus it can be appreciated that the specific structural and functional details disclosed herein may be representative and do not necessarily limit the scope of the embodiments.

(25) Referring now to FIG. 1, an embodiment of a wrapping (or roll-up) device **10** according to aspects or teachings of the present disclosure. As generally illustrated, a wrapping device **10** may include a base **12**, one or more connectors (e.g., one or more hooks **14**), an arm **16**, an opening or aperture **18**, and a handle **20**. In embodiments, such as generally illustrated, a handle **20** may include an extended portion **22**, a grip portion **23**, and a slot **24**.

(26) As generally shown in FIG. 1, the device **10** may include one or more connectors (e.g., hooks **14**) that may be connected to and/or extend from a base **12** to permit the device **10** to be connected or attached to a wall and/or other support structure. The connectors (e.g., hook(s) **14**) may be connected to the base **12** or, for some embodiments, may be formed as an integral or unitary portion of a base **12**. For example and without limitation, an embodiment of a device **10** may include one or more hooks (or hook-like features) **14** that can extend from a base **12** and connect or attach to (e.g., hang on) a portion of a wall or other support structure. The one or more connectors (such as hooks **14**) can be configured so that the device **10** may be portable and, as such, may be connected and disconnected at various positions and/or locations. For instance, with some applications, a device **10** may be connected to a portion of a stall, a wall, or other structure in a barn.

(27) In embodiments, an extended portion **22** of a handle **20** may extend through an aperture **18** provided in arm **16**. As generally illustrated, such an extended portion **22** may include a slot **24** that extends from an end of the extended portion **22** that is more remote from the arm **16**, and the slot **24** may be configured to receive or retain a portion of an article (e.g., a wrap or bandage) that is to be rolled up or wrapped.

(28) Additionally, with some embodiments, the device **10** may include a cleaner or brush **26**. In embodiments, a cleaner or brush **26** may be formed integrally with or connected to a portion of a device **10**, such as a base **12** or an arm **16**. The cleaner or brush **26** may be configured to include one or more bristles or scrapers that may dislodge and/or remove debris or other undesired materials from an article as portions of the article contact or brush by the cleaner or brush **26**. In embodiments, a cleaner or brush **26** may be rigid or may be biased in a position and may move slightly (e.g., rotate about a connection pivot) as an article, or portion thereof, moves upwardly as it is wrapped or rolled up.

(29) FIG. 2 generally illustrates a side view of a portion of an embodiment of a wrapping or roll-up device **10** according to aspects or teachings of the present disclosure. In embodiments, one or more connectors **14** may be formed integrally with a base **12**. The arm **16** may include an aperture **18** that is configured (e.g., sized, shaped, etc.) to receive and support a portion of a handle **20**. An embodiment of a handle **20** is generally illustrated in FIG. 3. As generally illustrated, a handle **20** may include a slot **24** and/or a formation (e.g., radially extending formation **25** that may be configured as a bump or ridge). The radially extending formation **25** may be formed separately or integrally with the extended portion **22** of the handle **20**, and the radially extending formation **25** may be sized to connect with a portion of the extended portion and may be configured to prohibit

the movement of the extended portion **22** through the aperture **18**. In embodiments, a separate connecting/locking component **27** may be included, and may be configured to retain or impede the extended portion **22** within the aperture **18** of the arm **16** and/or from movement in relation to the aperture **18** (e.g., translation through or in/out of the aperture).

(30) FIG. **4** generally illustrates an embodiment of a holder **30** that may be used in connection with a wrapping or roll-up device **10**. A holder **30** may include a grip portion **32** and a receiving portion **34**. A grip portion **32** may include a portion that is configured to be grasped and/or held by a user. A receiving portion **34** may be configured to receive a portion of an extended portion **22** of a handle **20**. In embodiments, a receiving portion may be configured to receive a portion of a handle **20** and to permit a portion (e.g., extended portion **22**) to rotate with the rotation of a handle. Another embodiment of a holder **30** is generally illustrated in FIG. **5**. However, the disclosure is not limited to the illustrated holders, and other forms of holders may be used in connection with the present concept.

(31) FIG. **6** generally illustrates another embodiment of a wrapping or roll-up device **10** in accordance with aspects or teachings of the present disclosure. As generally illustrated, the device **10** may include at least one connector **14** and may include a plate **29** that is disposed on a side of an aperture in an arm **16**. As generally illustrated, a connector, a base **12**, and/or an arm **16** may be formed integrally as a single unitary formation. In embodiments, a plate **29** (or other guide or boundary-type formation) may, inter alia, be configured to serve as a guide or boundary for an article (e.g., a strap or horse wrap) that is being rolled up or wrapped.

(32) Turning to FIG. **7**, another embodiment of a wrapping or roll-up device **10** is generally illustrated. The device **10** may include one or more connectors **14** that may be configured for attachment to a wall or support structure. As generally shown, embodiments of such a device may include two arms (e.g., **16A**, **16B**), which may be disposed at or about different/opposite ends of an extended portion **22** of a handle **20**.

(33) Another embodiment of a wrapping or roll-up device having two arms (e.g., **16A**, **16B**) is generally illustrated in FIG. **8**. As generally illustrated, a first arm **16A** may include an aperture **18** for receiving a portion of a handle **20** therethrough. In embodiments, first arm **16A** may be rigidly connected to a base **12**, and there may be little positional movement between the base **12** and the first arm **16A**. With embodiments, such as generally illustrated, second arm **16B** may be configured to receive a portion of an extended portion **22** of handle **20**, such as in a recess or aperture in second arm **16B**. Further, as generally illustrated (via arrow A), second arm **16B** may be configured to move/rotate/pivot away from an extended portion of a handle, for example, to permit a loading and/or unloading of an article to be rolled or wrapped up. For example and without limitation, arm **16B** may be hinged to swing apart from handle **20**. Such hinged connection may be in the form of an integral hinge or a hinge formed with additional components connected to base **12**.

Embodiments of a device **10** may also include a cleaner or brush **26** and/or a tensioning formation. The cleaner or brush **26** may be configured to include one or more bristles or scrapers that may dislodge and/or remove debris or other undesired materials from an article as portions of the article contact or brush by the cleaner or brush **26**. In embodiments, a cleaner or brush **26** may be formed with, or connected to, a portion of base **12** and/or arm **16A**. FIG. **9** generally illustrates a wrapping or roll-up device **10** that may be similar to that shown in FIG. **8**, and is shown with arm **16B** in an open position/configuration.

(34) For example and without limitation, with a wrapping or roll-up device **10**, an end portion of an article to be rolled up or wrapped may be positioned through a portion of a slot **24**—which may extend from an end of an extended portion **22** of a handle. In embodiments, that include a second arm **16B** (such as generally illustrated in FIGS. **7-9**), a second arm **16B** may be first opened (see, e.g., FIG. **9**) to permit an end of such an article to be inserted into/through slot **24**. Once the article is connected to the handle **20** as such, the handle may be turned (clockwise or counterclockwise) to roll/wrap up the article. In embodiments that include a holder **30**, such a holder **30** may be used to

help position and/or retain the article on or about the handle as the article is rolled up/wrapped up. In embodiments that include a second arm **16B**, such arm **16B** may be closed and/or connected to a portion of the handle as the handle is rotated to roll up/wrap up the article. Additionally, with embodiments that include a cleaner or brush **26**, the article may be draped over or positioned to brush by the cleaner or brush **26** as portions of the article move by such cleaner or brush **26**.

(35) Another embodiment of a wrapping (or roll-up) device **10** according to aspects or teachings of the present disclosure is generally illustrated in FIG. **10**. As generally illustrated, the wrapping device **10** may include a base **12**, one or more connectors **14** (e.g., **14A**, **14B**), at least one arm (e.g., **16**, **16A**) having an aperture or through-hole **18**, and a handle **20**.

(36) In embodiments, the device **10** may include a tensioner **28**. A tensioner **28** may be connected to, and extend from (e.g., perpendicular to) the base **12**. The tensioner **28** may be disposed vertically below the handle **20** and may be configured to provide tension (e.g., a slight pulling friction or resistance) to a portion of a wrap or article being rolled up/wrapped up by the device **10**—for example, to facilitate a tighter wrapping of a wrap or article. In embodiments, a tensioner **28** may comprise a beam or other horizontally extending structure or formation that provides some resistance to the rolling of the wrap or article. In some embodiments, such as illustrated, the tensioner **28** may include a slot (or slit) **31** or other form of opening that permits a wrap or article to extend therethrough and up to the handle. In embodiments, means or feature for brushing or cleaning a wrap—such as a set of bristles—may be included in connection with a tensioner **28** and/or slot **31**.

(37) In the illustrated embodiment, a handle is extended through two arms **16**, **16A**, which can provide alignment and support. Although, such a second arm **16A** may be optional for some embodiments. The arms may be rigidly connected to the base **12**—whether integrally formed therewith or attached or connected thereto. By way of example and without limitation, embodiments of connectors **14** may take the form of a hook, form of overhanging formation or feature, or other connectors for connection or attachment to a support surface such as a wall. While portability is commonly advantageous, if desired, a user could permanently or semi-permanently attach a device to a wall or other external formation (for example, by connecting the base **12** to a wall, such as by nail, screw, zip tie, and/or other fasteners). In embodiments, a device may be fastened (e.g., directly fastened), permanently or temporarily, to a support structure (such as a wall). For example and without limitations, a base **12** may include one or more locations and/or apertures that may facilitate the connection (e.g., by nailing or screwing) of a device **10** to a support structure. With such embodiments, a base may not need or include one or more connectors (e.g., a hook to extend over a portion of a wall).

(38) In embodiments, such as generally illustrated, a handle **20** may include a stop **21** (or formation **25** as previously disclosed), an extended portion **22**, a grip portion **23**, and a slot **24**. The one or more connectors may be as previously disclosed, and may be configured to provide portability to the device—e.g., permitting it to be readily moved from one location to another. Further, embodiments of a device **10** may include two connectors **14A**, **14B** that are spaced apart from one another at or about opposite ends of a base **1**, and which may provide stability to the attachment of the device **10** to another object or apparatus (such as a portion of a stall wall). In embodiments, one of more connectors **14** may, for example, be provided to have an established, set, and/or standard width (e.g., a width of an open wall portion of a horse stall) or may instead be configured in a variety of manners to have an adjustable gap or width. In embodiments, for example as generally shown in FIGS. **10** and **14**, the connectors **14A**, **14B** may include a slot **15** to permit adjustment of a gap/width and may further include a pin or screw **17** (e.g., a conventional screw, hand rotatable screw, or other fastener) to secure or fix a receiving gap/width between a portion of the connector **14A**, **14B** and the base **12**. For example and without limitation, in embodiments, a connector (e.g., **14**, **14A**, **14B**) may be configured to hang through or over a portion of a grating or wall (such as a stall) having a width of between about 1.5 in. and about 2 in. and/or may hang-down on a back end

between about 2 in. and about 4 in. Such dimensions may of course be modified to adapt to desired positioning and/or attachment to secure a device to various forms for support.

(39) As generally shown in FIG. 10, at least one stop **21** may be included on a portion of the handle **20** and may be configured to prevent a slidable portion of the handle **20** from moving further into/past an aperture. For example, a stop **21** may comprise a formation with an expanded radius that prevents the handle from further sliding or moving through an aperture. With some embodiments a stop may comprise a unitarily formed portion of an extended portion of a handle. With other embodiments, a stop may comprise a separate/distinct component that is attached or connected to a portion of an extended portion of a handle. Additionally, as generally shown in the illustrated wrapping (or roll-up) device **10**, embodiments of the device **10** may also optionally include a horizontally-spaced/remote receiving arm **16** and/or a formation **25**, which may be associated with (e.g., configured to connect to or include) a cleaner/brush/scrapper or other feature associated with the device. For example, a formation **25**, which may take a wide variety of sizes, shapes, materials, and forms and may include or present one or more cleaners, brushes, and/or scrapers to a wrap that is rolled up by the device. A remote receiving arm **16** may be provided at or about an opposing horizontal end of the device **10**, and may include an aperture through the arm **16** or a receiving formation formed in the arm **16** to receive a remote portion of the handle **20** (which includes the slot therein), and/or may be configured to be fixed in position, such as shown (whether formed as a unitary part of the base **12** or whether connected thereto) or may be configured to move/rotate/pivot away from an extended portion of a handle **20**. As with previously disclosed embodiments, arm **16** may be eliminated and, if desired, a separate guide or boundary-type formation may be employed to help guide an article to be wrapped.

(40) FIGS. 11-16 generally illustrated different views of the embodiment of the wrapping device **10** shown in FIG. 10.

(41) FIGS. 17-22 generally illustrate an embodiment of a method of rolling a wrap in connection with an embodiment of a device such as previously disclosed. FIG. 17 generally shows a device **10** that may be attached to a wall or board (e.g., a portion of a stall wall) having a width. The one or more connectors **14** may connect/secure the device **10** to such wall or board. The device is shown with a handle **20** in a first (or a retracted) position relative to a receiving arm **16**. Although, with embodiments that do not have a rigid receiving arm or formation, the handle **20** may not be required to be retracted as such. FIG. 18 generally illustrates how a portion or segment of an item to be wrapped (e.g., wrap W) may be positioned around a tensioner, or inserted through a slot **31** in a tensioner **28**, and may further be inserted through a slot **24** in the extended portion **22** of the handle **20**. FIG. 19 generally illustrates how a portion of the extended portion **22** of the handle **20** may be received by (or through) a receiving arm **16**—for example, to provide added stability to the handle **20**. FIG. 20 generally shows how, with the turning of the handle **20** (in a clockwise direction), the wrap W may be provided in a partially rolled-up condition. FIG. 21 generally illustrates the wrap W in a substantially fully rolled condition, FIG. 22 generally shows how the handle may be partially retracted and the wrap W may be removed from an end of the handle.

(42) In embodiments, the wrapping device may be comprised of metal, or may be primarily or predominantly comprised of metal. Such metal may comprise aluminum, steel, or other metals known in the art. In other embodiments, the wrapping device may be comprised of plastic, or primarily or predominantly comprised of plastic. Such plastic may comprise various plastic and composite materials, including, for example and without limitation, reinforced plastics, such as fiber-reinforced polymers or plastics or glass-reinforced polymers or plastics. Composite materials may have a polymer matrix reinforced with fibers (such as glass, carbon, aramid, basalt, or others). It is noted that with an embodiment a handle (or portions thereof) and/or one or more connector(s) may be comprised of metal, while various other components of the wrapping device may be comprised of a plastic, polymer, and/or rubber (e.g., a scraper, if included). In some embodiments, the handle **20**, the one or more connectors, and hardware (such as screws) may be comprised of

metal and the base **12** and arms **16**, **16A**, **16B** may be comprised of plastic.

(43) Reference throughout the specification to “various embodiments,” “with embodiments,” “in embodiments,” or “an embodiment,” or the like, means that a particular feature, structure, or characteristic described in connection with the embodiment is included in at least one embodiment. Thus, appearances of the phrases “in various embodiments,” “with embodiments,” “in embodiments,” or “an embodiment,” or the like, in places throughout the specification are not necessarily all referring to the same embodiment. Furthermore, the particular features, structures, or characteristics may be combined in any suitable manner in one or more embodiments. Thus, the particular features, structures, or characteristics illustrated or described in connection with one embodiment/example may be combined, in whole or in part, with the features, structures, functions, and/or characteristics of one or more other embodiments/examples without limitation given that such combination is not illogical or non-functional. Moreover, many modifications may be made to adapt a particular situation or material to the teachings of the present disclosure without departing from the scope thereof.

(44) It should be understood that references to a single element are not necessarily so limited and may include one or more of such elements. Any directional references (e.g., plus, minus, upper, lower, upward, downward, left, right, leftward, rightward, top, bottom, above, below, vertical, horizontal, clockwise, and counterclockwise) are only used for identification purposes to aid the reader's understanding of the present disclosure, and do not create limitations, particularly as to the position, orientation, or use of embodiments.

(45) Joinder references (e.g., attached, coupled, connected, and the like) are to be construed broadly and may include intermediate members between a connection of elements and relative movement between elements. As such, joinder references do not necessarily imply that two elements are directly connected/coupled and in fixed relation to each other. The use of “e.g.” and “for example” in the specification is to be construed broadly and is used to provide non-limiting examples of embodiments of the disclosure, and the disclosure is not limited to such examples. Uses of “and” and “or” are to be construed broadly (e.g., to be treated as “and/or”). For example, and without limitation, uses of “and” do not necessarily require all elements or features listed, and uses of “or” are inclusive unless such a construction would be illogical.

(46) While processes, systems, and methods may be described herein in connection with one or more steps in a particular sequence, it should be understood that such methods may be practiced with the steps in a different order, with certain steps performed simultaneously, with additional steps, and/or with certain described steps omitted.

(47) All matter contained in the above description or shown in the accompanying drawings shall be interpreted as illustrative only and not limiting. Changes in detail or structure may be made without departing from the present disclosure.

Claims

1. A wrapping or roll-up device, comprising: a base; one or more connectors connected to the base and configured to attach or connect the wrapping or roll-up device to a wall or support structure; a first arm extending from a portion of the base, the first arm including an aperture; a second arm extending from the base; and a handle including an extended portion and a grip portion, at least a portion of the extended portion configured to extend through the aperture; wherein the extended portion of the handle includes a slot disposed about an end of the extended portion remote from the grip portion, and the extended portion is configured to slide or translate back and forth through the aperture; wherein the second arm is pivotable or rotatable relative to the base and/or the extended portion.

2. The wrapping or roll-up device of claim 1, wherein the one or more connectors comprise one or more hooks.

3. The wrapping or roll-up device of claim 1, wherein the first arm extends substantially perpendicular to the base.
4. The wrapping or roll-up device of claim 1, wherein the one or more connectors comprise one or more screws, or fasteners.
5. The wrapping or roll-up device of claim 1, wherein a cleaner or brush is connected to the base, the arm, or the base and the arm.
6. The wrapping or roll-up device of claim 1, wherein the slot of the extended portion of the handle is configured to receive or retain a portion of an article to be rolled up.
7. The wrapping or roll-up device of claim 1, wherein the arm is integrally formed with the base as a unitary structure.
8. The wrapping or roll-up device of claim 1, wherein at least one of the one or more connectors is integrally formed with the base as a unitary structure.
9. The wrapping or roll-up device of claim 1, wherein the base and the arm are comprised of plastic.
10. The wrapping or roll-up device of claim 1, wherein the handle includes a stop or a radially extending formation configured as a bump or ridge.
11. The wrapping or roll-up device of claim 1, wherein the second arm includes a recess or an aperture configured to receive a portion of the extended portion.
12. The wrapping or roll-up device of claim 1, including a plate disposed on a side of the aperture of the arm.
13. The wrapping or roll-up device of claim 1, wherein one or more components are comprised of a metal.
14. A wrapping or roll-up device, comprising: a base; one or more connectors connected to the base and configured to attach or connect the wrapping or roll-up device to a wall or support structure; an arm extending from a portion of the base, the arm including an aperture; a handle including an extended portion and a grip portion, at least a portion of the extended portion configured to extend through the aperture; and a holder configured to receive at least a portion of the extended portion of the handle, the holder includes a grip portion and a receiving portion; wherein the extended portion of the handle includes a slot disposed about an end of the extended portion remote from the grip portion, and the extended portion is configured to slide or translate back and forth through the aperture; and the grip portion includes a portion configured to be grasped and/or held by a user and the receiving portion is configured to receive a portion of the extended portion of the handle.
15. A wrapping or roll-up device, comprising: a base; a first arm extending from a portion of the base and including an aperture; a receiving arm extending from a portion of the base and including a receiving portion or an aperture, the receiving arm being laterally or horizontally offset from the first arm; a second arm extending from a portion of the base and including an aperture, the second arm disposed laterally between the first arm and the receiving arm; a handle including an extended portion and a grip portion, at least a portion of the extended portion configured to extend through the aperture of the first arm; wherein the extended portion includes a slot disposed about an end of the extended portion remote from the grip portion, and the extended portion is configured to slide or translate back and forth through the aperture.
16. The wrapping or roll-up device of claim 15, including a tensioner.
17. The wrapping or roll-up device of claim 16, wherein the tensioner extends from the base and the tensioner includes a slot.
18. The wrapping or roll-up device of claim 15, including one or more connectors configured to connect the device to a wall or support.
19. The wrapping or roll-up device of claim 18, wherein the one or more connectors are configured to provide an adjustable gap or width between a portion of the one or more connectors and a portion of the base.
20. The wrapping or roll-up device of claim 19, wherein at least one connector comprises two

components extending in a direction perpendicular to the base, one or both of the two components includes a slot, and a portion of a pin or screw extends through the slot and secures the two components together in position.

21. A method for wrapping or rolling up an article via the wrapping or roll-up device of claim 15, comprising: securing the wrapping or roll-up device to a wall or support structure; extending the handle with the slot through the aperture of the first arm of the device; inserting a portion of the article through the slot of the handle; extending the handle through the receiving arm; rotating the handle to wrap or roll up the article about the handle; pulling back the handle from the receiving arm and removing the article from the handle.

22. The wrapping or roll-up device of claim 15, wherein at least the base, the first arm, the second arm, and the receiving arm are comprised of plastic.

23. The wrapping or roll-up device of claim 15, wherein one or more of the first arm, the second arm, and the receiving arm are separate components connected to the base.

24. The wrapping or roll-up device of claim 15, wherein one or more of the first arm, the second arm, and the receiving arm are press-fit or snap connected to the base.

25. A wrapping or roll-up device, comprising: a base comprised of plastic and extending in a vertical direction in a deployed state; a separate first arm comprised of plastic and connected to the base, the first arm extending from a portion of the base and including an aperture comprising a through-hole; a separate receiving arm comprised of plastic and connected to the base, the receiving arm extending from a portion of the base and including a receiving portion or an aperture, the receiving arm being laterally or horizontally offset along the base from the first arm; a handle including an extended portion and a grip portion, at least a portion of the extended portion configured to extend through the through-hole of the first arm and up to or through the aperture of the receiving arm, the extended portion including a slot disposed about an end of the extended portion remote from the grip portion, and at least a segment of the extended portion configured to slide or translate back and forth through the through-hole; a tensioner connected to and extending from the base, the tensioner including two portions separately connected to the base and a horizontally extending beam disposed vertically below the first arm and the receiving arm; and at least one connector extending from the base on an opposite side of the first arm and the receiving arm, the connector including a portion that is perpendicular to the base and a portion that is offset from and parallel to the base.
