Unless otherwise stated, the term "alkyl" itself or as part of another substituent refers to a straight chain (i.e. unbranched) or branched chain, or cyclic hydrocarbon group, or a combination thereof, which may be saturated, single or polyunsaturated, may include bivalent or polyvalent groups, with a specified amount of carbon atoms (i.e. C₁-C₁₀ means one to ten carbon atoms). Examples of saturated hydrocarbon groups include, but are not limited to, groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, s-butyl, cyclohexyl, cyclohexylmethyl, cyclopropylmethyl, etc., such as n-pentyl, n-hexyl, n-heptyl, n-octyl. Unsaturated alkyl is an alkyl group with one or more double or triple bonds. Examples of unsaturated alkyls include, but not limited to, vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadiene), 2,4-pentadienyl, 3-(1,4-pentadienyl), acetylene, 1-propynyl, 3-propynyl, 3-butynyl, and advanced homologues and isomers. The hydrocarbon group defined as alkyl is called homoalkyl. The alkyl is optionally replaced by one or more halogen atoms.

11

The term "fluoroalkyl" means the alkyl group as defined above, wherein, one or more hydrogen atoms are replaced by the fluorine atom.

The term "alkylene" itself or as part of another substituent group refers to a divalent group derived from an alkyl group, for example, but not limited to, $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$, $-\text{CH}_2\text{CH}=\text{CHCH}_2-$, $-\text{CH}_2\text{C}\equiv\text{CCH}_2-$, $-\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_2\text{CH}_2\text{CH}_3)\text{CH}_2-$. Alkyl (or alkylidene) usually has 1 to 24 carbon atoms, and the group with 10 or less carbon atoms is preferred in the present invention. "Lower alkyl" or "lower alkylene" refers to an alkyl or alkylene with a shorter chain, usually having eight or fewer carbon atoms. The alkylene is selectively replaced by one or more halogen atoms.

Unless otherwise specified, the term "heteroalkyl" itself or in combination with another term refers to a stable linear or branched chain, or cycloalkyl group, or a combination thereof, consisting of at least one carbon atom and at least one heteroatom selected from O, N, P, Si, S, wherein the nitrogen atom, phosphorus atom or sulfur atom may be selectively oxidized and the nitrogen atom may be selectively quaternized. Heteroatoms O, N, P, S and Si can be placed at any position in the heteroalkyl group or at the position where the alkyl group is connected with the rest of the molecule. Examples include, but not limited to, $-\text{CH}_2-\text{CH}_2-\text{O}-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{N}(\text{CH}_3)-\text{CH}_3$, $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-$, $-\text{S}(\text{O})-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{S}(\text{O})_2-\text{CH}_3$, $-\text{CH}=\text{CHO}-\text{CH}_3$, $-\text{Si}(\text{CH}_3)_3$, $-\text{CH}_2-\text{CH}=\text{N}-\text{OCH}_3$, $-\text{CH}=\text{CH}-\text{N}(\text{CH}_3)-\text{CH}_3$, $-\text{O}-\text{CH}_3$, $-\text{O}-\text{CH}_2-\text{CH}_3$ and $-\text{CN}$. At most two or three heteroatoms can be continuous. For example, $-\text{CH}_2-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_2-$ and $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_2-$. Similarly, the term "heteroalkylene" itself or in combination with other terms refers to divalent groups derived from heteroalkyl groups, such as, but not limited to, $-\text{CH}_2-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_2-$ and $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_2-$. For heteroalkylenes, heteroatoms may be at either or both ends of the chain (e.g., alkyleneoxy, alkylene-dioxy, alkyleneamino, alkylene-diamino, etc.). In addition, for the alkylene and heteroalkylene groups, the writing direction of the molecular formula of the connecting group does not indicate the orientation of the connecting group. For example, the formula $-\text{C}(\text{O})\text{OR}'-$ means $-\text{C}(\text{O})\text{OR}'-$ and $-\text{R}'\text{OC}(\text{O})-$. As mentioned above, heteroalkyl groups used herein include those groups that are connected to the rest of the molecule by heteroatoms, such as $-\text{C}(\text{O})\text{R}'$, $-\text{C}(\text{O})\text{NR}'$, $-\text{NR}'\text{R}'$, $-\text{OR}'$, $-\text{SR}'$ and/or $-\text{SO}_2\text{R}'$.

12

Where reference is made to "heteroalkyl" followed by specific heteroalkyl such as $-\text{NR}'\text{R}'$, it should be understood that the terms heteroalkyl and $-\text{NR}'\text{R}'$ are not repetitive or exclusive. Instead, these specific heteroalkyl groups are cited for clarity. In addition, the term "haloalkyl" refers to monohaloalkyl and Polyhaloalkyl. For example, the term "halogenated (C₁-C₄) alkyl" includes, but not limited to, trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-Bromopropyl, etc.

"Prodrug" refers to the substance converted into the parent drug in vivo. In some cases, prodrugs are often used because they are easier to administer than parent drugs. For example, prodrugs can be bioavailable by oral administration, while parent drugs cannot. In the pharmaceutical composition, the prodrug may also have a higher solubility than the parent drug. Examples of prodrugs, but not limited to, can be any of the compounds of formula I, which are applied in the form of esters (prodrugs) to promote transmembrane transport. Water solubility in the cell membrane is harmful to migration, and once in a water-soluble beneficial cell, the esters are then metabolized and hydrolyzed to the active substance carboxylic acid. Another example of prodrugs can be a short peptide (poly amino acid) bonded to an acid group, wherein, the peptide is metabolized to release the active portion.

Optical Isomers, Diastereomers, Geometric Isomers and Tautomers Since the compounds of the present invention contain one or more asymmetric centers, they can be used as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and single diastereomers. When referring to compounds of the invention or compounds of formula A, it should be understood that all these isomeric forms are included.

Some of the compounds described in this paper contain olefinic double bonds, including E and Z geometric isomers unless otherwise specified.

Some compounds of formula A may contain one or more ring systems, so cis- and trans isomers may exist. The present invention is intended to encompass all of these cis- and trans-isomers.

Some of the compounds described herein may have different sites connected with hydrogen atoms, which are called tautomers. Such examples can be ketones and their

enol forms called ketone enol tautomers. A single tautomer and a mixture thereof are included in the compound of formula A. The compound of formula A can be separated from diastereoisomeric pairs of the enantiomers, for example by fractional crystallization from a suitable solvent, such as methanol or ethyl acetate or their mixture. A pair of enantiomers thus obtained can be separated into individual stereoisomers by conventional methods, such as using optically active amines or acids as resolution reagents or in chiral HPLC columns.

Alternatively, any enantiomer of the compound of general formula A can be obtained by stereospecific synthesis using optically pure raw materials or reagents of known configuration.

In addition, compounds of formula A can also include a series of stable isotope labeled analogues. For example, one or more protons in the compound of formula A can be replaced by deuterium atoms, thus providing deuterated analogues with improved pharmacological activity.

Improved release formulations include delayed release, sustained release, pulsed release, controlled release, targeted release and programmed release.

In the case of dry powder inhalers and aerosols, the dose unit is determined by a valve that provides a metering

17

quantity. The units of the invention are usually arranged for dosing doses or "sprays" containing compounds of 0.001 to 10 mg compound A.

The total daily dose usually ranges from 0.001 to 10 mg and can be administered as a single dose or more commonly as a batch dose within a day.

The compound of formula A can also be used for rectal administration of drugs in the form of suppository. These compositions can be prepared by mixing the drug with a suitable non irritating excipient, which is solid at room temperature but liquid at rectal temperature and therefore melt in the rectum to release the drug. These substances are cocoa butter and polyethylene glycol.

For topical use, cream, ointment, gel, solution or suspension containing compound A are used. (For the purpose of the present application, topical application shall include mouthwash and gargle).

Dose levels of about 0.01 mg to about 140 mg/kg body weight per day are useful in the treatment of the above conditions, or about 0.5 mg to about 7 g per patient per day. For example, inflammation can be effectively treated by applying about 0.01 to 50 mg compound per kilogram of body weight per day, or by applying about 0.5 mg to 3.5 g compound per patient per day, preferably 2.5 mg to 1 g compound per person per day.

The amount of active ingredients that can be combined with the carrier material to produce a single dosage form will vary according to the host being treated and the specific mode of administration. For example, preparations for human oral administration may contain 0.5 mg to 5 g of an active agent, the active agent is compounded with a convenient amount of carrier material, and the carrier material may vary from about 5% to about 95% of the total composition. Dosage unit forms generally contain about 1 mg to about 500 mg of active ingredients, usually 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg or 1000 mg.

However, it should be understood that the specific dose level for any particular patient depends on a number of factors, including age, weight, general health, gender, diet, administration time, route of administration, excretion rate, drug combination, and the severity of the specific disease being treated.

In Vivo Efficacy Assessment

In the subcutaneous transplantation tumor model of human diffuse large B lymphoma TMD8 cells in NOD/SCID mice, the inhibitory effect of example 1 on tumor growth was tested. Tumor growth and animal body weight were presented in FIG. 1 and FIG. 2 as followed. Example 1 was administered orally once a day at 30 mg/kg, or twice a day at 10→5 mg/kg, which had obvious inhibitory effect on the growth of subcutaneous transplanted TMD8 tumor. The tumor growth inhibition rate (TGI) after 22 days of administration was 49.6% and 52.7% respectively. Example 1 had no significant effect on animal body weight at 30 mg/kg dose when administered orally once a day. Animal body weight decreased slightly at 10 mg/kg dose administered orally twice a day for 8 successive days. Therefore, the dose was adjusted to 5 mg/kg and continued to administrate for 14 days.

FIG. 1 showed the volumes of subcutaneous xenograft TMD8 tumor (mean SD) of the solvent control group and each treatment group during administration. The results showed that 22 days after the initial administration, the compound of the invention showed significant therapeutic effect, and the therapeutic effect was equivalent to that of the positive drug ibrutinib.

102

FIG. 2 showed the changes in the body weight (mean SD) of the solvent control group and the animals in each treatment group during administration. The results showed that the compound of example 1 of the invention showed significant anti-tumor effect without showing obvious influence on the body weight of animals.

According to the experimental results, example 1 of the invention showed significant anti-tumor effect, which significantly inhibited the growth of tumor without showing obvious influence on the body weight of animals.
