PARP1 INHIBITORS AND USES THEREOF

CROSS-REFERENCE

This application is a continuation of U.S. patent application Ser. No. 18/433,128 filed Feb. 5, 2024, which is a continuation of U.S. patent application Ser. No. 18/099,770 filed Jan. 20, 2023, now U.S. Pat. No. 11,939,329, which claims the benefit of U.S. Provisional Application Ser. No. 63/301,907 filed Jan. 21, 2022 and U.S. Provisional Application Ser. No. 63/376,338 filed Sep. 20, 2022, each of which are hereby incorporated by reference in their entirety.

BACKGROUND OF THE INVENTION

Poly(ADP-ribose)polymerase (PARP) or poly(ADP-ribose)synthase (PARS) has an essential role in facilitating DNA repair, controlling RNA transcription, mediating cell death, and regulating immune response. These actions make PARP inhibitors targets for a broad spectrum of disorders. PARP inhibitors have demonstrated efficacy in numerous models of disease, particularly in models of ischemia reperfusion injury, inflammatory disease, degenerative diseases, protection from adverse effects of cytotoxic compounds, and the potentiation of cytotoxic cancer therapy. PARP has also been indicated in retroviral infection and thus inhibitors may have use in antiretroviral therapy. PARP inhibitors have been efficacious in preventing ischemia reperfusion injury in models of myocardial infarction, stroke, other neural trauma, organ transplantation, as well as reperfusion of the eye, kidney, gut, and skeletal muscle. Inhibitors have been efficacious in inflammatory diseases such as arthritis, gout, inflammatory bowel disease, CNS inflammation such as MS and allergic encephalitis, sepsis, septic shock, hemorrhagic shock, pulmonary fibrosis, and uveitis. PARP inhibitors have also shown benefit in several models of degenerative disease including diabetes (as well as complications) and Parkinson's disease. PARP inhibitors can ameliorate the liver toxicity following acetaminophen overdose, cardiac and kidney toxicities from doxorubicin and platinum based antineoplastic agents, as well as skin damage secondary to sulfur mustards. In various cancer models, PARP inhibitors have been shown to potentiate radiation and chemotherapy by increasing cell death of cancer cells, limiting tumor growth, decreasing metastasis, and prolonging the survival of tumor-bearing animals.

PARP1 and PARP2 are the most extensively studied PARPs for their role in DNA damage repair. PARP1 is activated by DNA damage breaks and functions to catalyze the addition of poly (ADP-ribose) (PAR) chains to target proteins. This post-translational modification, known as PARylation, mediates the recruitment of additional DNA repair factors to DNA lesions.

Following completion of this recruitment role, PARP auto-PARylation triggers the release of bound PARP from DNA to allow access to other DNA repair proteins to complete repair. Thus, the binding of PARP to damaged sites, its catalytic activity, and its eventual release from DNA are all important steps for a cancer cell to respond to DNA damage caused by chemotherapeutic agents and radiation therapy.

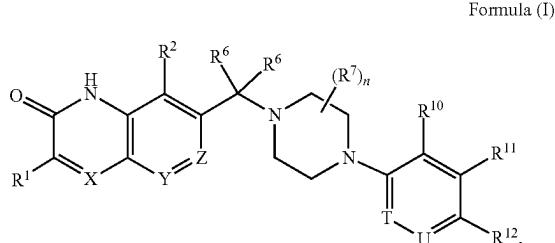

Inhibition of PARP family enzymes has been exploited as a strategy to selectively kill cancer cells by inactivating complementary DNA repair pathways. A number of pre-clinical and clinical studies have demonstrated that tumor cells bearing deleterious alterations of BRCA1 or BRCA2, key tumor suppressor proteins involved in double-strand

DNA break (DSB) repair by homologous recombination (HR), are selectively sensitive to small molecule inhibitors of the PARP family of DNA repair enzymes. Such tumors have deficient homologous recombination repair (HRR) pathways and are dependent on PARP enzymes function for survival. Although PARP inhibitor therapy has predominantly targeted SRCA-mutated cancers, PARP inhibitors have been tested clinically in non-SRCA-mutant tumors, those which exhibit homologous recombination deficiency (HRD).

It is believed that PARP inhibitors having improved selectivity for PARP1 may possess improved efficacy and reduced toxicity compared to other clinical PARP1/2 inhibitors. It is believed also that selective strong inhibition of PARP1 would lead to trapping of PARP1 on DNA, resulting in DNA double strand breaks (DSBs) through collapse of replication forks in S-phase. It is believed also that PARP1-DNA trapping is an effective mechanism for selectively killing tumor cells having HRD. An unmet medical need therefore exists for effective and safe PARP inhibitors. Especially PARP inhibitors having selectivity for PARP1.

The term “optional” or “optionally” means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. For example, “optionally substituted alkyl” means either “alkyl” or “substituted alkyl” as defined above. Further, an optionally substituted group may be un-substituted (e.g., —CH₂CH₃), fully substituted (e.g., —CF₃CF₃), mono-substituted (e.g., —CH₂CH₂F) or substituted at a level anywhere in-between fully substituted and mono-substituted (e.g., —CH₂CHF₂, —CH₂CF₃, —CF₂CH₃, —CFHCHF₂, etc.). It will be understood by those skilled in the art with respect to any group containing one or more substituents that such groups are not intended to introduce any substitution or substitution patterns (e.g., substituted alkyl includes optionally substituted cycloalkyl groups, which in turn are defined as including optionally substituted alkyl groups, potentially ad infinitum) that are sterically impractical and/or synthetically non-feasible. Thus, any substituents described should generally be understood as having a maximum molecular weight of about 1,000 daltons, and more typically, up to about 500 daltons.

The term “one or more” when referring to an optional substituent means that the subject group is optionally substituted with one, two, three, or four substituents. In some embodiments, the subject group is optionally substituted with one, two, or three substituents. In some embodiments, the subject group is optionally substituted with one or two substituents. In some embodiments, the subject group is optionally substituted with one substituent. In some embodiments, the subject group is optionally substituted with two substituents.

An “effective amount” or “therapeutically effective amount” refers to an amount of a compound administered to a mammalian subject, either as a single dose or as part of a series of doses, which is effective to produce a desired therapeutic effect.

The terms “treat,” “treated,” “treatment,” or “treating” as used herein refers to therapeutic treatment, wherein the object is to slow (lessen) an undesired physiological condi-

12

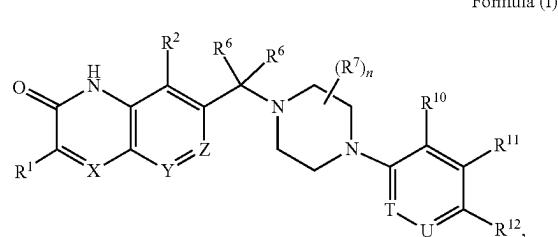

tion, disorder, or disease, or to obtain beneficial or desired clinical results. For the purposes described herein, beneficial or desired clinical results include, but are not limited to, alleviation of symptoms; diminishment of the extent of the condition, disorder or disease; stabilization (i.e., not worsening) of the state of the condition, disorder or disease; delay in onset or slowing of the progression of the condition, disorder or disease; amelioration of the condition, disorder or disease state; and remission (whether partial or total), whether detectable or undetectable, or enhancement or improvement of the condition, disorder or disease. Treatment includes eliciting a clinically significant response without excessive levels of side effects. Treatment also includes prolonging survival as compared to expected survival if not receiving treatment. The terms “treat,” “treated,” “treatment,” or “treating” as well as words stemming therefrom, as used herein, do not necessarily imply 100% or complete treatment. Rather, there are varying degrees of treatment of which one of ordinary skill in the art recognizes as having a potential benefit or therapeutic effect. In this respect, the disclosed methods can provide any amount of any level of treatment of the disorder in a mammal. For example, a disorder, including symptoms or conditions thereof, may be reduced by, for example, about 100%, about 90%, about 80%, about 70%, about 60%, about 50%, about 40%, about 30%, about 20%, or about 10%. “Synergy” or “synergize” refers to an effect of a combination that is greater than additive of the effects of each component alone at the same doses.

As used herein, a “disease or disorder associated with PARP” or, alternatively, “a PARP-mediated disease or disorder” means any disease or other deleterious condition in which PARP, or a mutant thereof, is known or suspected to play a role.

As used herein, a “disease or disorder associated with PARP1” or, alternatively, “a PARP1-mediated disease or disorder” means any disease or other deleterious condition in which PARP1, or a mutant thereof, is known or suspected to play a role.

The absolute label (abs) is added to a chiral center to denote that it is unambiguously a pure sample of the drawn stereoisomer.

The OR label (or) denotes a pure substance, but the absolute configuration of the stereochemical center is unknown. After chiral separation with pure structures isolated, multiple OR labels (OR indicates purity) with the same numerical value will indicate that a sample is one of

a pair of pure enantiomers (but the absolute configuration of the stereochemical center is unknown).
60

The AND label (and) denotes both isomers are present at the depicted stereochemical center. Assigning different numerical values to the AND labels denotes that they are independent of each other. The use of AND labels with the same values indicate that the two stereocenters are relative to each other and can only change in concert.

In some embodiments, the compound disclosed herein, or a pharmaceutically acceptable salt, solvate, or stereoisomer thereof, is selected from

Further Forms of Compounds Disclosed Herein

Isomers/Stereoisomers

In some embodiments, the compounds described herein exist as geometric isomers. In some embodiments, the compounds described herein possess one or more double bonds. The compounds presented herein include all cis, trans, syn, anti, entgegen (E), and zusammen (Z) isomers as well as the corresponding mixtures thereof. In some situations, the compounds described herein possess one or more chiral centers and each center exists in the R configuration, or S configuration. The compounds described herein include all diastereomeric, enantiomeric, and epimeric forms as well as the corresponding mixtures thereof. In additional embodiments of the compounds and methods provided herein, mixtures of enantiomers and/or diastereoisomers, resulting from a single preparative step, combination, or interconversion are useful for the applications described herein. In some embodiments, the compounds described herein are prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. In some embodiments, dissociable complexes are preferred. In some embodiments, the diastereomers have distinct physical properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and are separated by taking advantage of these dissimilarities. In some embodi-

ments, the diastereomers are separated by chiral chromatography, or preferably, by separation/resolution techniques based upon differences in solubility. In some embodiments, the optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization.

51

In some embodiments, the cancer is a cancer deficient in Flomologous Recombination (FIR) dependent DNA DSB repair activity. The FIR dependent DNA DSB repair pathway repairs double-strand breaks (DSBs) in DNA via homologous mechanisms to reform a continuous DNA helix. The components of the FIR dependent DNA DSB repair pathway include, but are not limited to, ATM (NM_000051), RAD51 (NM_002875), RAD51 L1 (NM_002877), RAD51 C (NM_002876), RAD51 L3 (NM_002878), DMC1 (NM_007068), XRCC2 (NM_005431), XRCC3 (NM_005432), RAD52 (NM_002879), RAD54L (NM_003579), RAD54B (NM_012415), BRCA1 (NM_007295), BRCA2 (NM_000059), RAD50 (NM_005732), MRE11 A (NM_005590) and NBS1 (NM_002485). BRCA1 and BRCA2 are known tumor suppressors whose wild-type alleles are frequently lost in tumors of heterozygous carriers. Amplification of the EMSY gene, which encodes a BRCA2 binding factor, is also known to be associated with breast and ovarian cancer. Carriers of mutations in BRCA1 and/or BRCA2 are also at elevated risk of certain cancers, including breast cancer, ovarian cancer, pancreatic cancer, prostate cancer, a hematological cancer, gastrointestinal cancer, and lung cancer.

20 Dosing

In certain embodiments, the compositions containing the compound(s) described herein are administered for prophylactic and/or therapeutic treatments. In certain therapeutic applications, the compositions are administered to a patient already suffering from a disease or condition, in an amount sufficient to cure or at least partially arrest at least one of the symptoms of the disease or condition. Amounts effective for this use depend on the severity and course of the disease or condition, previous therapy, the patient's health status, weight, and response to the drugs, and the judgment of the treating physician. Therapeutically effective amounts are optionally determined by methods including, but not limited to, a dose escalation and/or dose ranging clinical trial.

In prophylactic applications, compositions containing the compounds described herein are administered to a patient susceptible to or otherwise at risk of a particular disease, disorder, or condition. Such an amount is defined to be a "prophylactically effective amount or dose." In this use, the precise amounts also depend on the patient's state of health, weight, and the like. When used in patients, effective amounts for this use will depend on the severity and course of the disease, disorder or condition, previous therapy, the patient's health status and response to the drugs, and the judgment of the treating physician. In one aspect, prophylactic treatments include administering to a mammal, who previously experienced at least one symptom of or risk factor for the disease being treated and is currently in remission, a pharmaceutical composition comprising a compound described herein, or a pharmaceutically acceptable salt, solvate, or stereoisomer thereof, in order to prevent a return of the symptoms of the disease or condition.

55 In certain embodiments wherein the patient's condition does not improve, upon the doctor's discretion the administration of the compounds are administered chronically, that is, for an extended period of time, including throughout the duration of the patient's life in order to ameliorate or otherwise control or limit the symptoms of the patient's disease or condition.

60 In certain embodiments wherein a patient's status does improve, the dose of drug being administered is temporarily reduced or temporarily suspended for a certain length of time (i.e., a "drug holiday"). In specific embodiments, the length of the drug holiday is between 2 days and 1 year, including by way of example only, 2 days, 3 days, 4 days,

5 days, 6 days, 7 days, 10 days, 12 days, 15 days, 20 days, 28 days, or more than 28 days. The dose reduction during a drug holiday is, by way of example only, by 10%-100%, including by way of example only 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, and 100%.

Once improvement of the patient's conditions has occurred, a maintenance dose is administered if necessary. Subsequently, in specific embodiments, the dosage, or the frequency of administration, or both, is reduced, as a function of the symptoms, to a level at which the improved disease, disorder or condition is retained. In certain embodiments, however, the patient requires intermittent or daily treatment on a long-term basis upon any recurrence of symptoms.

The amount of a given agent that corresponds to such an amount varies depending upon factors such as the particular compound, disease condition and its severity, the identity (e.g., weight, sex) of the subject or host in need of treatment, but nevertheless is determined according to the particular circumstances surrounding the case, including, e.g., the specific agent being administered, the route of administration, the condition being treated, and the subject or host being treated.

In general, however, doses employed for adult human treatment are typically in the range of 0.01 mg-5000 mg per day. In one aspect, doses employed for adult human treatment are from about 1 mg to about 1000 mg per day. In one embodiment, the desired dose is conveniently presented in a single dose or in divided doses administered simultaneously or at appropriate intervals, for example as two, three, four or more sub-doses per day.

In one embodiment, the daily dosages appropriate for the compound described herein, or a pharmaceutically acceptable salt, solvate, or stereoisomer thereof, are from about 0.01 to about 50 mg/kg per body weight. In some embodiments, the daily dosage, or the amount of active in the dosage form are lower or higher than the ranges indicated herein, based on a number of variables in regard to an individual treatment regime. In various embodiments, the daily and unit dosages are altered depending on a number of variables including, but not limited to, the activity of the compound used, the disease or condition to be treated, the mode of administration, the requirements of the individual subject, the severity of the disease or condition being treated, and the judgment of the practitioner.

Toxicity and therapeutic efficacy of such therapeutic regimens are determined by standard pharmaceutical procedures in cell cultures or experimental animals, including, but not limited to, the determination of the LD₁₀ and the ED₉₀. The dose ratio between the toxic and therapeutic effects is the therapeutic index and it is expressed as the ratio between LD₅₀ and ED₅₀. In certain embodiments, the data obtained from cell culture assays and animal studies are used in formulating the therapeutically effective daily dosage range and/or the therapeutically effective unit dosage amount for use in mammals, including humans. In some embodiments, the daily dosage amount of the compounds described herein lies within a range of circulating concentrations that include the ED₅₀ with minimal toxicity. In certain embodiments, the daily dosage range and/or the unit dosage amount varies within this range depending upon the dosage form employed and the route of administration utilized.

In any of the aforementioned aspects are further embodiments in which the effective amount of the compound described herein, or a pharmaceutically acceptable salt, solvate, or stereoisomer thereof, is: (a) systemically admin-

istered to the mammal; and/or (b) administered orally to the mammal; and/or (c) intravenously administered to the mammal; and/or (d) administered by injection to the mammal; and/or (e) administered topically to the mammal; and/or (f) administered non-systemically or locally to the mammal.

In any of the aforementioned aspects are further embodiments comprising single administrations of the effective amount of the compound, including further embodiments in which (i) the compound is administered once a day; or (ii) 10 the compound is administered to the mammal multiple times over the span of one day.

15 which (i) the compound is administered continuously or intermittently: as in a single dose; (ii) the time between multiple administrations is every 6 hours; (iii) the compound is administered to the mammal every 8 hours; (iv) the compound is administered to the subject every 12 hours; (v) 20 the compound is administered to the subject every 24 hours. In further or alternative embodiments, the method comprises a drug holiday, wherein the administration of the compound is temporarily suspended or the dose of the compound being administered is temporarily reduced; at the end of the drug 25 holiday, dosing of the compound is resumed. In one embodiment, the length of the drug holiday varies from 2 days to 1 year.

Example A: Cell Growth Inhibition Assay

Cell proliferation was measured through the cell viability assay using DLD-1 BRCA2(−/−) and parental isogenic pair and MDA-MB-436 (mutated BRCA1) cell lines. The Cell-Titer-Glo (CTG) based cell viability assay is designed to determine the number of viable cells in the culture because of compound effect, by quantifying ATP, which indicates the presence of metabolically active cells.

DLD-1 BRCA2(−/−) and parental isogenic pair were cultured in RPMI 1640 supplemented with 1000 fetal bovine serum (FBS), and MDA-NM-436 cells were cultured in DMEM supplemented with 10% FBS. Both were cultured at 37°C. with 500 CO₂. Invention compounds were distributed to the 384 well plate (Corning, 3764) using Echo acoustic liquid handler to form a 1:3 serially diluted final concentration with top dose of 10 or 30 μM. The cells were seeded into the plate in the density of 50 cells/well (DLD-1 parental), 200 cells/well (DLD-1 BRCA2(−/−)), or 500 cells/well (MDA-MB-436). After a short spun, the cells were cultured in a well moisturized incubator at 37°C. with 5% CO₂ for 7 days without disturbance. The cell viability was measured by CellTiter Glo 2.0 assay kit (Promega, G9243), and growth inhibition rate was calculated and plotted against final compound concentration, and the data were fitted in Xfit to generate IC₅₀ values.

Example B: Biochemical (FP) Assay

Assays based on fluorescent polarization (FP) have been widely utilized in drug discovery due to the homogenous format, robust performance and lack of interference seen in other assays. Compounds were characterized using an assay measuring the displacement of a commercially available fluorescently labeled PARP 1/2 inhibitor (PARPi-FL, Tocris Biosciences, #6461) as exemplified in assays performed in WO2014/064149 and WO2021/013735A1. The assay was performed utilizing the following method:

Compounds were dissolved in DMSO an Echo550 liquid handler was utilized to make serial dilutions in the desired concentration range in Optiplate-384F plates. 100% DMSO was used for the high (with protein) and low (without protein) control samples. 20 nL of compound or DMSO alone was added to individual assay plate wells.

PARP1 and PARP2 protein were expressed, purified, and diluted in assay buffer containing 50 mM Tris pH 8.0, 0.001% Triton X-100, 10 mM MgCl₂, 150 mM NaCl to a final concentration of 20 nM. The PARPi-FL was then added at a final concentration of 3 nM.

The assay plate was centrifuged at 1000 rpm for 1 min and incubated for 4 h at room temperature.

15 The fluorescent polarization was read using an Envision plate reader using the following settings:

Excitation filter —FITC FP 480-Ex Slot 3

Emission filter —FITC FP P-pol 535-Em Slot4

20 2nd Emission filter —FITC FP S-pol 535-Em Slot 3

Mirror module —FITC FP Dual Enh-Slot 1

The inhibition rate was calculated using the percentage of permuted Mahalanobis distances greater than the control samples (mP value) following the equation below:

mP_c: the mP value of compounds

mP_L: the mP value of Low controls

mP_H: the mP value of High controls

$$\text{Inhibition (\%)} = \left(1 - \frac{mP_C - mP_L}{mP_H - mP_L} \right) \times 100\%$$

35 XLFit (equation 201) is used to calculate a reported IC₅₀ for each compound.

The data from examples A and B are provided in Table 3.

Madin-Darby canine kidney (MDCKII) cells expressing MDR1 and BCRP were seeded onto Corning HITS Transwell® 96-well polycarbonate permeable (0.4 μm pore) supports at a density of 545,000 cells/cm². Cells were incubated for 4-8 days prior to assay, and monolayer integrity was assessed by measuring transepithelial electrical resistance (TEER). Test and reference compounds were diluted with the transport buffer (HBSS HEPES pH7.4) to concentrations of 10 and 1 μM, respectively. The final organic solvent concentration was 0.5% (v/v). end of the incubation, samples from the apical and basolateral side were taken and then precipitated with acetonitrile containing internal standard. After centrifugation at 3200×g, supernatants were diluted 1:1 (v/v) with water and subjected to analysis via HPLC-MS/MS. The integrity

The apparent permeability (Papp, units of ×10⁻⁶ cm/s) was calculated using the following equation:

$$Papp = (dQ/dt)/(A \times D0)$$

Where dQ/dt was the rate of drug transport (pmol/s), A was the surface area of the membrane (0.143 cm²), and D0 was the initial donor concentration (nM or pmol/cm³).

$$\text{Efflux ratio} = Papp(B \rightarrow A)/Papp(A \rightarrow B)$$

Where Papp(B → A) is the apparent permeability in the basolateral-to-apical direction, and Papp(A → B) is the apparent permeability in the apical-to-basolateral direction

Determination of Fraction Unbound in Plasma (Pu)

The equilibrium dialysis method was used to investigate the in vitro binding of test articles and reference compounds to plasma proteins. Plasma samples containing 5 μM test article or blank dialysis buffer solution (PBS, pH 7.4) were added to separate chambers of the dialysis wells of the High Throughput equilibrium Dialysis (HTD) device. The dialysis plate was sealed and placed in an incubator at 37°C. with 5% CO₂ with shaking at approximately 100 rpm for 6 hours. All experiments were performed in duplicate. Ketoconazole (5 μM) was used as the reference compound. After incubation, the seal was removed, and 50 μL of post-dialysis samples were pipetted from both buffer and plasma chambers into fresh 96-well plates. Samples were equimatrilyzed by either addition of blank plasma to buffer samples or the addition of blank buffer to plasma samples. Subsequently, 400 μL (4 volumes) of acetonitrile containing internal were added to all samples to precipitate proteins prior to analysis by UPLC-MS/MS to determine the relative concentrations of test articles. The unbound fractions in plasma were calculated using the concentrations of test articles in buffer and plasma samples according to the following equation:

$$50 \quad \text{Percentage unbound (\%)} =$$

$$\frac{\text{Analyte to IS Peak Area Ratio (buffer chamber)}}{\text{Analyte to IS Peak Area Ratio (plasma chamber)}} \times 100$$

Determination of Fraction Unbound in Brain Homogenate (Bu)

The equilibrium dialysis method was used to investigate the in vitro binding of test articles and reference compounds to rodent brain homogenate. Brains collected from naïve animals were weighed and homogenized in 4 volumes of PBS, pH 7.4. Brain homogenate samples containing 1 μM test article or blank dialysis buffer solution (PBS, pH 7.4) were added to separate chambers of the dialysis wells of the High Throughput equilibrium Dialysis (HTD) device. The dialysis plate was sealed and placed in an incubator at 37°C. with 5% CO₂ with shaking at approximately 100 rpm for

127

6 hours. All experiments were performed in duplicate. Telmisartan (5 µM) was used as the reference compound. After incubation, the seal was removed, and 50 µL of post-dialysis samples were pipetted from both buffer and brain homogenate chambers into fresh 96-well plates. Samples were equimatrilyzed by either addition of blank homogenate to buffer samples or the addition of blank buffer to homogenate samples. Subsequently, 400 µL (4 volumes) of acetonitrile containing internal were added to all samples to precipitate proteins prior to analysis by UPLC-MS/MS to determine the relative concentrations of test articles. The unbound fractions in diluted brain homogenate were calculated using the concentrations of test articles in buffer and homogenate samples according to the following equation:

Percentage unbound homogenate (%) =

$$\frac{\text{Analyte to IS Peak Area Ratio (buffer chamber)}}{\text{Analyte to IS Peak Area Ratio (homogenate chamber)}} \times 100$$

Correction to percentage unbound in undiluted brain was achieved with the following equation:

Percentage unbound brain (%) =

$$100 \times \frac{1}{\left(\frac{1}{\text{Percentage unbound homogenate}/100} - 1 \right) + 1/5}$$

Determination of the Drug Brain-to-Plasma Partition Coefficient (K_p) and Drug Unbound K_p (K_{p,uu}) in Rat

Compounds were formulated either individually or in a cassette (as a mixture) at a concentration of 0.1 mg/mL/compound in sterile water containing 0.5% (w/v) methylcellulose 400 cP and administered to male Sprague-Dawley rats via oral gavage at a dose volume of 10 mL/kg. One animal was sacrificed at each of the following time points: 0.5, 1, 2, 4, 8, and 24 hours post-dose, and brain and blood samples were collected. Plasma was prepared from blood via refrigerated centrifugation, and plasma samples were stored frozen at -80° C. until bioanalysis. Brain samples were rinsed with saline to remove residual blood and blotted dry with a paper wipe. Brain samples were then weighed and homogenized with 3 volumes (v/w) of water and stored frozen at -80° C. until bioanalysis.

Prior to bioanalysis, plasma and brain samples were extracted with 4 volumes of acetonitrile containing internal standard and centrifuged for 15 minutes. Supernatants were diluted with 2 volumes of water and injected for analysis via HPLC-MS/MS. Plasma and brain homogenate drug concentrations were determined against calibration curves generated by spiking blank rat plasma or brain homogenate with drug across an appropriate concentration range. The brain

128

homogenate concentration was corrected for the homogenization buffer dilution factor yielding total brain drug concentrations.

The brain-to-plasma partition coefficient (K_p) was determined for each compound, calculated as: AUC_{brain}:AUC_{plasma}, provided that was identical in each matrix. If the drug concentration versus time profile for one matrix fell below the lower limit of quantification at a time point earlier than in the other matrix, then the brain K_p was calculated as the average of the ratios of total brain drug concentration to total plasma drug concentration measured at each time point where drug concentrations in both matrices were quantifiable.

The K_{p,uu} was then calculated from the K_p using the following equation: K_{p,uu}=K_p*(fraction unbound in brain homogenate/fraction unbound in plasma).

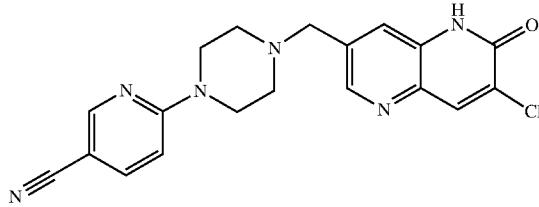

The data from examples C and D are provided in Table 4.
