**[0001]** This application is a continuation of U.S. application Ser. No. 18/651,214, filed on Apr. 30, 2024, which is a continuation of International Patent Application No. PCT/CN2023/100361, filed Jun. 15, 2023, which claims the priorities of Chinese Patent Application No. 202210675599.3, filed on Jun. 15, 2022, Chinese Patent Application No. 202211627919.4, filed on Dec. 16, 2022, and Chinese Patent Application No. 202310658843.X, filed on Jun. 5, 2023, the entire disclosure of each of which is incorporated herein by reference for all purposes.

FIELD OF THE DISCLOSURE

**[0002]** The present disclosure relates to a five-membered ring-fused six-membered ring compound, preparation method therefor, and pharmaceutical composition and use thereof.

BACKGROUND OF THE DISCLOSURE

**[0003]** Kinases have always been important therapeutic targets for the development of anti-inflammatory drugs (Current Opinion in Cell Biology 2009 21, 1-8). Interleukin-1 receptor-associated kinases (IRAKs) are serine/threonine protein kinases that belong to tyrosine-like kinase (TLK) family. IRAKs are located downstream of toll-like receptors and IL-1R pathways, and IRAK1 and IRAK4 have kinase activity. IRAK4 acts upstream of the IRAKs family kinase activation pathway and plays an important role in innate immune signaling (Science 1996, 271 (5252): 1128-31). Stimulation of TLR can recruit myeloid differentiation primary response 88 (MYD88) and activate receptors to form a complex Myddosome, which then forms a complex with IRAK4 to activate IRAK1. Subsequently, TRAF6 is activated by IRAK1, leading to the activation of NF- $\kappa$ B and AMPK signaling pathways, ultimately leading to the expression of inflammatory cytokines (Molecules 2016, 21, 1529, J Biol Chem. 2018 Sep. 28; 293 (39): 15195-15207, Eur J Immunol. 2008. 38:614-618).

**[0004]** As a very important property, IRAK4 has two functions of scaffolding and kinase phosphorylation in the TLR and IL-1R signaling pathways. The kinase domain (KD) provides the kinase function, and the death domain (DD) provides the scaffolding function for Myddosome (Molecules 2016, 21 (11), 1529). Myddosomes are related to a variety of diseases, not only to autoimmune and inflammatory diseases but also to cancer. For example, 39% of patients with active B-cell-like diffuse large B-cell lymphoma (ABC DLBCL) and 86%-100% of patients with several other types of B-cell malignancies and primary central nervous system lymphomas have MYD88 mutations (Cell Chemical Biology 27, 1-10, Dec. 17, 2020).

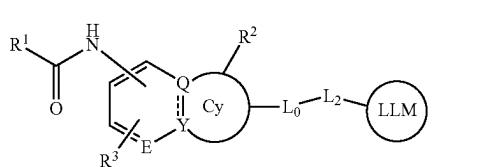

**[0005]** IRAK4 gene knockout mice and clinical pathology studies have shown that IRAK4 deficiency itself is nonlethal, and individuals with IRAK4 mutations are also been protected from chronic lung disease and inflammatory bowel disease (Eur. J. Immunol. 2008. 38:614-618). IRAK4 inhibitors have been considered as targets for the treatment of immune diseases such as autoimmune diseases rheumatoid arthritis (RA), systemic lupus erythematosus (SLE) and

psoriasis (Expert Opinion on Therapeutic Patents Volume 29, 2019-Issue 4). Meanwhile, IRAK4 is also a popular target for treating tumors, and there are currently several IRAK4 kinase inhibitors entering the clinical stage. However, these drugs under development in clinical stages are all inhibitors having IRAK4 kinase function to kinase domain (KD) and have no direct inhibitory effect on the scaffolding function of IRAK4. Protein degraders (PROTACs) targeting IRAK4 are expected to simultaneously eliminate its kinase activity and scaffolding functions, resulting in a better and broader efficacy (Nature Biotechnology 2020, volume 38, pages 1221-1223, ACS Med Chem Lett. 2019 Jul. 11; 10 (7): 1081-1085).

[0347] If a linker is expressed as "absent", the structures on both sides of the linker are directly connected by a single bond, for example -A-B-C-. When B is not present, -A-B-C- is -A-C-.

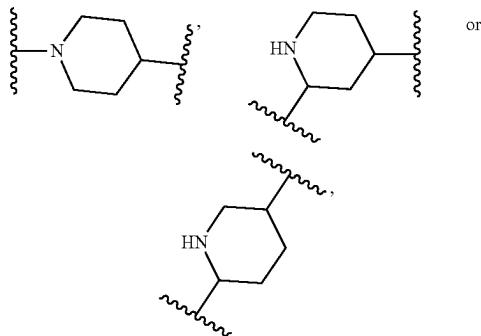

[0348] The term " $\dagger$ " refers to presence or absence.

[0349] The term "oxo" means that the hydrogen or lone pair of electrons on the non-oxygen atom is replaced by oxygen. For example,

## Example 7: Synthesis of I-30

-continued

**Step 1: Synthesis of (I-30-1)**

**[0428]** Under nitrogen protection, 4-bromo-2-methoxy-5-methyl-aniline (1 g, 4.63 mmol), 6-(trifluoromethyl)pyridine-2-carboxylic acid (1.06 g, 5.55 mmol), DIPEA (1.20 g, 9.26 mmol, 1.61 mL) and anhydrous THF (15 mL) were added to the reaction flask and cooled to 0° C. T<sub>3</sub>P (2.95 g, 9.26 mmol) was slowly added dropwise, and the reaction was stirred at 25° C. for 1 hour. H<sub>2</sub>O (60 mL) was added to the reaction system. The product was precipitated, filtered, the filter cake was washed with water, and dried under vacuum to obtain the product I-30-1 as white solid (1.77 g, yield 98.16%), MS (ESI) m/z: 389.2 [M+H]<sup>+</sup>.

**Step 2: Synthesis of (I-30-2)**

**[0429]** Under nitrogen protection, I-30-1 (1.77 g, 4.54 mmol), phenyl formate (1.1 g, 9.08 mmol), Pd(OAc)<sub>2</sub> (palladium acetate, 101 mg, 0.45 mmol), P(t-Bu)<sub>3</sub>-HBF<sub>4</sub> (tri-tert-butylphosphine tetrafluoroborate, 516.4 mg, 1.78 mmol), Et<sub>3</sub>N (triethylamine, 917.08 mg, 9.08 mmol), and acetonitrile (3 mL) were added into a reaction bottle, and warmed to 80° C. for reaction overnight. The mixture was returned to room temperature, filtered, and the filtrate was concentrated under reduced pressure, added with ethyl acetate to dilute, washed twice with saturated brine, dried over anhydrous sodium sulfate, filtered, and concentrated under reduced pressure to obtain a crude product, which was purified by reverse-phase C18 column chromatography (mobile phase 0-60% water/acetonitrile) to obtain product I-30-2 as a white solid (1.3 g, yield 70%), MS (ESI) m/z: 431.1 [M+H]<sup>+</sup>.

**Step 3: Synthesis of (I-30-3)**

**[0430]** I-30-2 (1.3 g, 3.2 mmol), potassium carbonate (1.77 g, 12.8 mmol) and methanol (4 mL) were added to a reaction bottle and reacted at room temperature for 2 hours. Water was added to precipitate a product, which was filtered, and the filter cake was washed with water and vacuum-dried to obtain a crude product. The crude product was purified by reversed-phase C18 column chromatography (mobile phase 0-60% water/acetonitrile) to obtain product I-30-3 as a white solid (900 mg, yield 75%), MS (ESI) m/z: 369.1 [M+H]<sup>+</sup>.

**Step 4: Synthesis of (I-30-4)**

**[0431]** Under nitrogen protection, I-30-3 (900 mg, 2.4 mmol), NBS (512.6 mg, 2.88 mmol), AIBN (39 mg, 0.24 mmol) and CCl<sub>4</sub> (9 mL) were added into a reaction bottle, warmed to 80° C., and reacted for 5 hours. The reaction solution was returned to room temperature and filtered, and the filtrate was added with H<sub>2</sub>O (30 mL), and extracted with EA (25 mL×3). The organic phases were combined, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated under reduced pressure to obtain a crude product, which was purified by reverse-phase C18 column chromatography, eluting with (MeCN/H<sub>2</sub>O+1% HCOOH) to obtain the desired product I-30-4 as a white solid (802 mg, yield 76%), MS (ESI) m/z: 447.1 [M+H]<sup>+</sup>.

**Step 5: Synthesis of (I-30-5)**

**[0432]** A mixed solution of I-30-4 (300 mg, 670.84 μmol), 2-amino-7-azaspiro[3.5]non-7-carboxylic acid tert-butyl ester (177.35 mg, 737.92 μmol), DIPEA (260.10 mg, 2.01 mmol, 350.53 μL) and ACN (4 mL) was stirred at 25° C. for 3 hours. The reaction solution was added with H<sub>2</sub>O (20 mL), and extracted with EA (15 mL×3). The combined organic phases were washed with saturated brine (20 mL), dry over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The crude product was purified by flash silica gel column chromatography (DCM:MeOH=30:1) to obtain product I-30-5 as a brown solid (135 mg, yield 35.02%), MS (ESI) m/z: 575.3 [M+H]<sup>+</sup>.

**Step 6: Synthesis of (I-30-6)**

**[0433]** I-30-5 (135 mg, 234.95 μmol) was dissolved in DCM (3 mL), added with TFA (1.5 mL), and stirred at 25° C. for 2 hours. The resulting mixture was concentrated under reduced pressure to obtain product I-30-6 as a white solid (86 mg, yield 70.32%, TFA salt), MS (ESI) m/z: 475.2 [M+H]<sup>+</sup>.

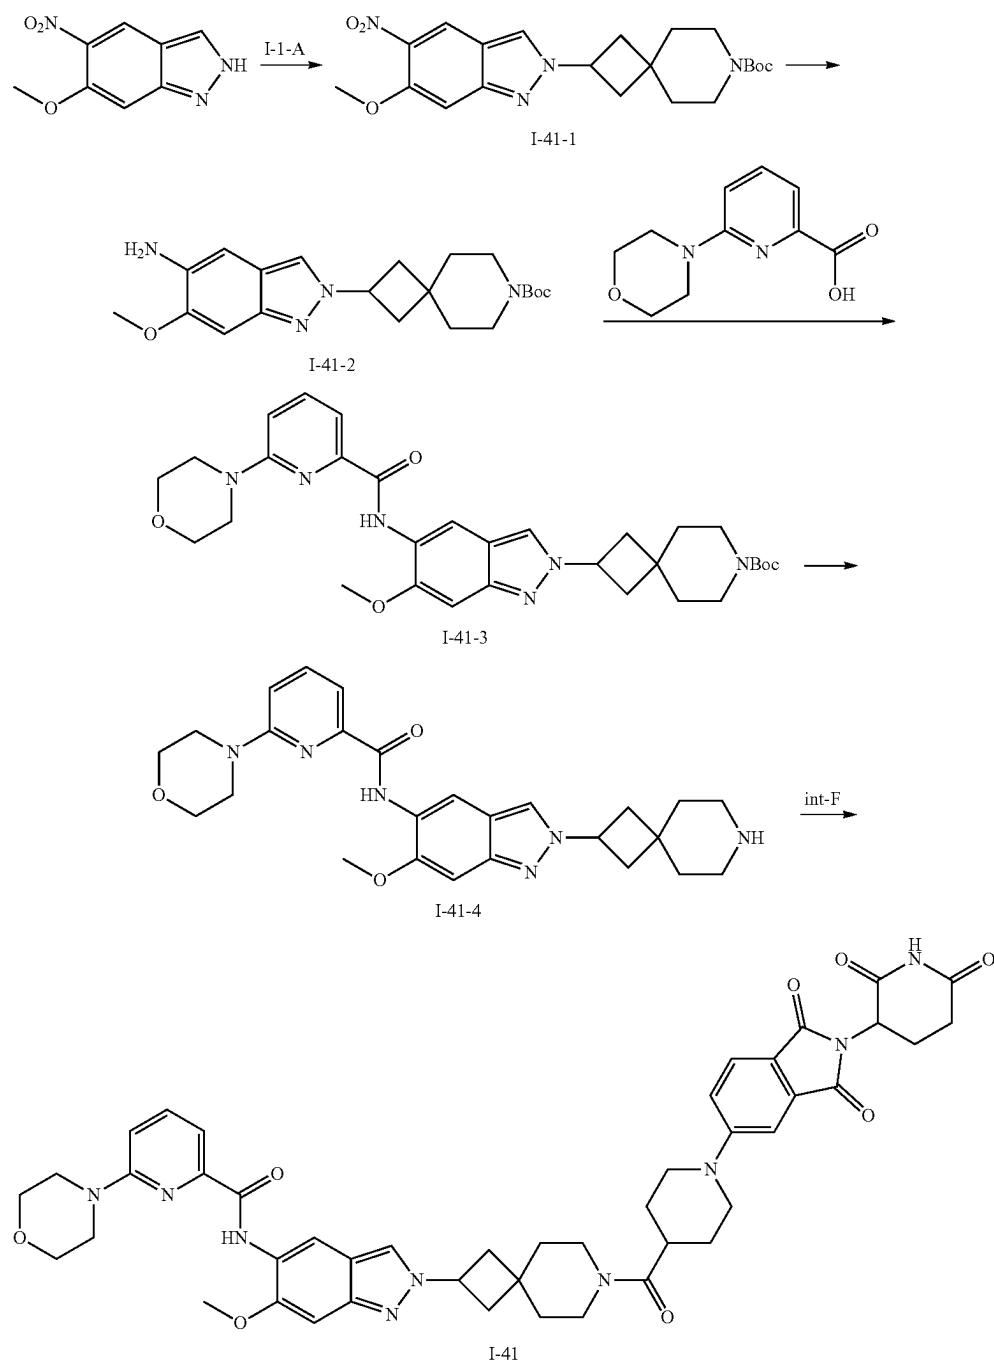

**Step 7: Synthesis of (I-30)**

**[0434]** A mixed solution of I-30-6 (40 mg, 76.85 μmol), int-F (32.58 mg, 84.53 μmol), HATU (35.06 mg, 92.22 μmol), DIPEA (39.73 mg, 307.40 μmol, 53.54 μL) and DMF (2 mL) was stirred at 25° C. for 1 hour. The reaction solution

was added with H<sub>2</sub>O (25 mL), and extracted with EA (20 mL×3). The combined organic phases were washed with saturated brine (20 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The crude product was purified by preparative thin layer chromatography (DCM:MeOH=20:1) to obtain product I-30 as a yellow solid (27 mg, yield 40.90%). <sup>1</sup>H NMR (500 MHz, DMSO-d<sub>6</sub>) δ 11.08 (s, 1H), 10.58 (s, 1H), 8.67 (s, 1H), 8.48 (d, J=7.5 Hz, 1H), 8.42 (t, J=8.0 Hz, 1H), 8.25 (d, J=7.5 Hz, 1H), 7.66 (d, J=8.5 Hz, 1H), 7.36 (s, 1H), 7.33 (d, J=1.5 Hz,

**Step 1: Synthesis of (I-41-1)**

**[0435]** Under nitrogen protection, a mixture of 6-methoxy-5-nitro-2H-indazole (1.17 g, 6.07 mmol), DMF (12 mL), cesium carbonate (4.94 g, 15.17 mmol) and I-1-A (3 g, 7.59 mmol) was stirred at 90° C. for 3 hours. The reaction mixture was returned to room temperature, added with H<sub>2</sub>O (60 mL), and extracted with DCM (35 mL×3). The combined organic phases were washed with saturated brine (50 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The crude product was purified by flash silica gel column chromatography (DCM/MeOH=98/2) to obtain product I-41-1 as a white solid (770 mg, yield 24.38%), MS (ESI) m/z: 417.5 [M+H]<sup>+</sup>.

**Step 2: Synthesis of (I-41-2)**

**[0436]** Under a hydrogen atmosphere, I-41-1 (770 mg, 1.85 mmol) was dissolved in MeOH (7 mL), added with catalyst wet Pd/C (80 mg, 10% purity), and reacted at 25° C. for 4 hours. The reaction solution was filtered through diatomaceous earth to remove the catalyst, and the filtrate was concentrated under reduced pressure to obtain product II-41-2 as a yellow solid (500 mg, yield 69.97%), MS (ESI) m/z: 387.2 [M+H]<sup>+</sup>.

**Step 3: Synthesis of (I-41-3)**

**[0437]** A mixed solution of II-41-2 (50 mg, 129.37 μmol), 6-morpholinepyridine-2-carboxylic acid (26.94 mg, 129.37 μmol), HATU (49.19 mg, 129.37 μmol), DIPEA (33.44 mg, 258.74 μmol, 45.07 μL) and DMF (2 mL) was stirred at 25° C. for 2 hours. The reaction solution was added with H<sub>2</sub>O (300 mL), and extracted with EA (20 mL×3). The combined organic phases were washed with saturated brine (20 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The crude product was purified by

preparative thin layer chromatography to obtain product II-41-3 as a white solid (64 mg, yield 85.78%), MS (ESI) m/z: 577.5 [M+H]<sup>+</sup>.

**Step 4: Synthesis of (I-41-4)**

**[0438]** A mixed solution of I-41-3 (63 mg, 109.25 μmol), TFA (2 mL) and DCM (2 mL) was stirred at 25° C. for 1 hour. The reaction solution was concentrated under reduced pressure to obtain product I-41-4 as a yellow oil (64 mg, crude product, TFA salt), MS (ESI) m/z: 477.3 [M+H]<sup>+</sup>.

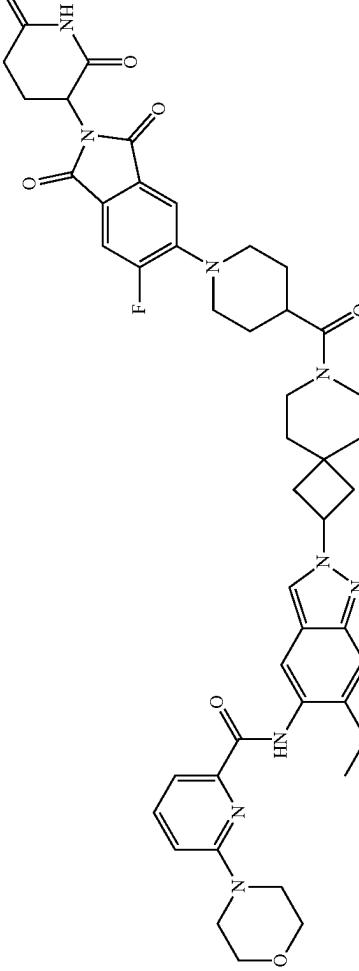

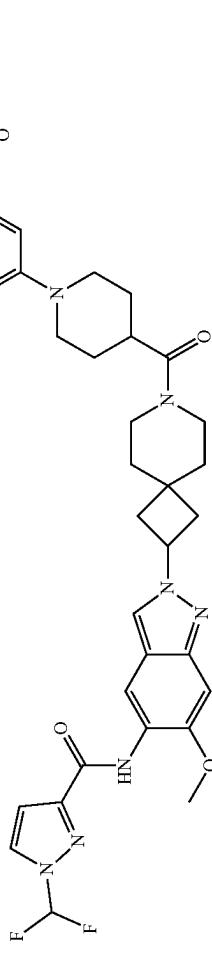

**Step 5: Synthesis of (I-41)**

**[0439]** A mixed solution of I-41-4 (52 mg, 109.11 μmol), int-F (42.05 mg, 109.11 μmol), HATU (41.49 mg, 109.11 μmol), DIPEA (28.20 mg, 218.23 μmol, 38.01 μL) and DMF (2 mL) was stirred at 25° C. for 2 hours. The reaction solution was added with H<sub>2</sub>O (300 mL), and extracted with EA (20 mL×3). The combined organic phases were washed with saturated brine, dried over anhydrous sodium sulfate, and purified by preparative thin layer chromatography to obtain the product I-41 as a yellow solid (28 mg, yield 29.80%), MS (ESI) m/z: 844.6 [M+H]<sup>+</sup>. <sup>1</sup>H NMR (500 MHz, DMSO-d<sub>6</sub>) δ 11.08 (s, 1H), 10.79 (s, 1H), 8.64 (s, 1H), 8.33 (s, 1H), 7.84-7.78 (m, 1H), 7.67 (d, J=8.5 Hz, 1H), 7.46 (d, J=7.0 Hz, 1H), 7.33 (s, 1H), 7.25 (d, J=8.5 Hz, 1H), 7.18 (s, 1H), 7.16 (d, J=8.5 Hz, 1H), 5.22-5.12 (m, 1H), 5.07 (dd, J=12.5, 5.5 Hz, 1H), 4.11-4.03 (m, 2H), 3.97 (s, 3H), 3.84-3.78 (m, 4H), 3.69-3.59 (m, 4H), 3.56-3.39 (m, 4H), 3.15-3.05 (m, 2H), 3.04-2.95 (m, 1H), 2.93-2.84 (m, 1H), 2.68-2.53 (m, 2H), 2.48-2.32 (m, 4H), 2.05-1.99 (m, 1H), 1.75-1.57 (m, 8H).

## Example 9: Synthesis of I-43

## Step 1: Synthesis of (I-43-1)

**[0441]** A mixture of 5-fluoroisobenzofuran-1,3-dione (0.9 g, 8.6 mmol), 6-aminopyridazine-3 (2H)-one (1.3 g, 7.8 mmol), NaOAc (1.3 g, 15.5 mmol) and HOAc (7 mL) was stirred at 80° C. for 16 hours. The mixture was returned to room temperature and concentrated under reduced pressure. The residue was poured into water and stirred. The solid was precipitated, filtered, washed with diethyl ether, and the filter cake was dried under vacuum to obtain the product I-43-1 as a white solid (1.2 g, yield 55%), MS (ESI) m/z: 260.2 [M+H]<sup>+</sup>.

## Step 2: Synthesis of (I-43-2)

**[0442]** To a solution of I-43-1 (1.1 g, 4.4 mmol) in anhydrous DMSO (10.0 mL) was added DIEA (1.14 g, 8.8 mmol) and piperidine-4-carboxylic acid tert-butyl ester (0.82 g, 4.4 mmol), and the mixture was reacted at 90° C. for 2 hours. The mixture was returned to room temperature, diluted with water (100 mL), and extracted with ethyl acetate (80 mL×3). The combined organic phases were

#### Application Examples

##### 1. Evaluation of Inhibitory Effects of Compounds on Kinase Activity

**[0535]** Based on an experimental method of fluorescence microfluidic mobility detection, an IC<sub>50</sub> value of competitive binding of kinase IRAK4 to ATP by the compounds was determined. The initial detection concentration of the compounds was 10 μM, diluted 4-fold gradient down to 0.38 nM, and tested in duplicate. Among them, commercial staurosporine was the standard control substance in this experiment.

## 1.2 Experimental Operation Method

[0536] 1) IRAK4 kinase was dissolved in kinase buffer (50 mM HEPES pH 7.5, 10 mM MgCl<sub>2</sub>, 2 mM DTT and 0.01% Brij-35) to a final concentration of 6 nM.

[0537] 2) The substrate peptide FAM-P8 and ATP were dissolved in the above kinase buffer. The final concentrations of the IRAK4 substrate peptide FAM-P8 and ATP were 3 μM and 10 μM respectively.

[0538] 3) Dilution of the compounds: the compound was first diluted to 50 μM, and then diluted down with a 4-fold gradient of DMSO. The solution without the compound and kinase is used as a blank control, corresponding to the “minimum value” shown below; and the solution without the compound but with kinase, adenosine 5'-triphosphate disodium salt hydrate, DMSO and buffer is used as a positive control, corresponding to the “maximum value” shown below.

[0539] 4) Kinase reaction and termination: 10 μL of kinase buffer was added to a 384-well plate containing 5 μL of the compound to be tested, and incubated at room temperature for 10 minutes. Another 10 μL of buffer containing the substrate peptide and adenosine 5'-triphosphate disodium salt hydrate was added to the 384-well plate. After incubation at 28° C. for one hour, 25 μL stop solution (100 mM HEPES pH 7.5, 50 mM EDTA, 0.2% Coating Reagent #3 and 0.015% Brij-35) was added to each well to terminate the reaction.

[0540] 5) Data reading: the CaliperEZ Reader II instrument was used to read the conversion rate data. Conditions: downstream voltage—500V, upstream voltage—2250V, base pressure—0.5 PSI, and screening pressure—1.2 PSI.

[0541] 6) Data calculation: the conversion rate data was copied from CaliperEZ Reader II and converted into inhibition rate data. The calculation formula is as follows:

$$\text{Inhibition percentage (\%)} = \frac{(\text{maximum value} - \text{conversion rate})}{(\text{maximum value} - \text{minimum value})} * 100\%$$

[0542] IC<sub>50</sub> values were fitted using XLFit excel add-in version 5.4.0.8,

Fitting formula:  $Y = \text{Bottom} + (\text{Top} - \text{Bottom}) / (1 + (IC_{50}/X)^{\text{HillSlope}})$

[0543] Kinase activity data are shown in Table 1 or 2

**2. Detection of PROTAC-Induced IRAK4 Protein Degradation in THP-1**

**[0544]** 2.1 Based on the experimental method of Western Blot, specific antibodies were used to stain the THP-1 cell samples treated by gel electrophoresis, and the degrading activity of the compounds on the IRAK4 protein in THP-1 cells was determined by analyzing the position and depth of staining. The concentrations of compound for the detection included 0 μM, 0.3 μM, 1 μM and 3 μM, and the cells were treated by the compound for 8 hours, 16 hours, 24 hours, and 48 hours. Glyceraldehyde-3-phosphate dehydrogenase (GAPDH) is an internal reference protein in this experiment.

#### 2.4 Method for Preparing the Reagents

[0546] Electrophoresis buffer: 50 mL MOPS SDS Running Buffer (20×) and 50 mL 20×TBS Tween-20 buffer were diluted with deionized water to 1 L as the electrophoresis buffer;

[0547] 5% skim milk (w/v): 2.5 g skim milk was diluted with 50 mL 1×TBS Tween-20 buffer to prepare 5% skim milk;

[0548] 5% BSA (w/v): 2.5 g BSA was diluted with 50 mL 1×TBS Tween-20 buffer to prepare 5% BSA;

[0549] Anti-IRAK4 antibody was diluted with 5% BSA at 1:1000 into a primary antibody working solution;

[0550] Goat Anti-Rabbit IgG H&L (HRP) was diluted with 5% BSA at 1:2000 into a second antibody working solution; and

[0551] Goat Anti-Mouse IgG H&L (HRP) was diluted with 5% BSA at 1:2000 into a second antibody working solution.

[0552] THP-1 cells were plated in a 6-well plate at a density of  $1.5 \times 10^6$  cells per ml and incubated for 2 hours in a cell culture incubator under 37° C. and 5% CO<sub>2</sub>. The compound was diluted with DMSO to 0.6 mM, 0.2 mM and 0.06 mM respectively. 10 μL of compound solution was added to the corresponding wells, and continued to incubate in the incubator for 16 hours, 24 hours and 48 hours respectively. The compound-treated THP-1 cells in the well were collected, added with 120 μL of RIPA lysate containing protease inhibitor, Phosphatase Inhibitor Cocktail 2 and Phosphatase Inhibitor Cocktail 3, lysed on wet ice for 30 minutes, and then the cells lysate was centrifuged at a high speed and a low temperature for 5 minutes to collect the supernatant. The protein concentration of the cell sample was determined according to the instructions in the Pierce™ BCA Protein Assay Kit.

[0553] The concentration of the sample was adjusted to be consistent using lysis buffer and NuPAGE® LDS sample buffer containing 1M DTT. The samples were heated at 95° C. for 5 minutes and centrifuged at a low temperature and at a high speed. 20 μL of the prepared protein sample and 4 μL of PageRuler Prestained Protein Ladder were added into the gel well for running at 80V voltage for 0.5 hours, then the voltage was adjusted to 120V for further running for 1.5 hours. The gel was removed and the proteins in the gel were transferred to the iBlot™ 2 transfer membrane set at 20V. After successful transfer, bands at 65 kDa-40 kDa and 40 kDa-30 kDa were cut respectively. The membranes were blocked with 5% skim milk for 1 hour at room temperature. The membranes were washed three times with 1× concentration of TBST, then incubated with IRAK4 antibody working solution overnight at 4° C. The IRAK4 antibody working solution was discarded, and the membranes were washed three times with 1× concentration of TBST, and incubated with Goat Anti-Rabbit IgG H&L (HRP) working solution and Goat Anti-Mouse IgG H&L (HRP) working solution at room temperature. After 1 hour of incubation, the antibody working solution was discarded and the membranes were washed three times with 1× concentration of TBST. According to the instructions of the kit SuperSig-

nal™ West Femto Maximum Sensitivity Substrate, the reagents in the kit were mixed in equal volume proportions to prepare a luminescent liquid mixture. The membranes were incubated for 1 minute, then removed for exposure.

[0554] The results of Western blotting 24 hours after administration of the compounds with a concentration of 1 μM were shown in Table 3:
